Well of course it is simple textbook RF engineering. Every network link should have an analysis done of its fade margin and path profile. That's easy to do with programs like TA. Once you've identified the problems, then you take steps to fix them. Some fixes involve a change in antenna or a bit more power, some require changes in routing topology, some require you to abandon a particular path until such time as you can establish an adequate relay link. Etc. Trying to include a marginal link in the network winds up hurting everyone's performance, so you don't want to do that.

>>They have more overhead

>we exponentially back off all the way to hell.

Well, no argument about that at HF, but we can engineer our VHF/UHF links to avoid that sort of problem. It takes a bit of care and thought, but *radio* is supposed to be our thing, so we should do the radio links properly as our first priority. Only if the characteristics of our best efforts are still horrible should we start looking to protocol bandaids to work around them. Those bandaids always cost us throughput compared to what we'd get with a well engineered RF link.

>>We don't have to invent new link level protocols to have satisfactory packet

>substitutes adequitely that thing we hope/want Santa to bring.

We've managed to RF engineer a rather robust network here. It took some money, and lots of time, but we're organized to raise the money, and we've expended the time.

>>If the links are poor quality, of course, then performance suffers. On HF, the links

>
>If the error rate can be synthetically improved, it will be as good as antenna
>gain. A dB is a dB. Thus your argument can be applied to VHF/UHF as well.
>RF engineering stops at the radio. Systems engineering starts when the radios
>don't work when you hook them to an antenna and move them apart by 45 miles.

If they don't work at 45 miles, then see what distance your link budget and path analysis will permit. Then separate them by that distance, or raise the antennas, add antenna gain or power, etc, so that they will work at 45 miles. Any overhead which is added to *every* packet won't yield the same improvement as improving the underlying RF infrastructure will. Just saying a db is a db fails to recognize that overhead cost because throughput is no longer equal.

Using FEC imposes a cost. You have to be careful to include that cost in the analysis to see if it results in a net gain in performance for the overall network or not. Most times
on VHF/UHF, IMHO, it doesn't. It only helps on a problem link or two while imposing a cost on every link in the network. It makes more sense to fix that problem link or two rather than imposing the cost of FEC on the whole network.

If you *must* use a problem link, then it should be isolated from the overall RF network and gatewayed into it. That isolates the large amounts of overhead on that particular link from the rest of the network. We do that for our HF links, using Clover on those links, but isolating that usage from the rest of the network by the gateway machines (routers).

With hardware level FEC in the 56 kb modems, we can set any link to use FEC, or not use FEC, without impacting any other link in the system. It is transparent to the protocol. That's really handy because we don't have to impose FEC on the entire network just to resolve one problem link. It does require dedicated modems between the switches for the problem link, but since they are the minority, that doesn't raise system cost that much.

IMHO it doesn't make sense to assume from the start that every link is going to be a problem link. It makes more sense to me to RF engineer the link budgets so that problem links are the exception rather than the rule. Then you can isolate those problem links and treat them separately to solve their unique problems.

Note, for *mobile* use, the situation can be different, and uniform use of FEC can be beneficial to the entire mobile network. I've been talking about fixed site VHF/UHF networks above. For mobile networks, the paths are always changing, so we can't apply a simple RF engineering link budget and path analysis to them. But most amateur networks are currently fixed site, and we can apply ordinary textbook RF engineering to the links. That'll generally give us the best network performance for the money and effort spent.

Your friends are right. Crystal control is the way to go, and receiver
filters broad enough to have good phase linearity are needed too.
The TEKK is designed to be a data radio. There are a few others
like it on the market too (notably a Motorola model sold surplus
in Nuts & Volts). At US $150 crystalled for your frequency, the
TEKK is actually not that expensive. You can't buy a new FM
voice radio for that.

Trying to cram faster packet data rates through a conventional
FM voice radio, particularly a synthesized one, is generally a
mistake. QST prints a BER test result for any radio it reviews
which claims packet capability. Perusing those test results is
illuminating. Virtually none of the "9600 baud ready" radios really
are 9600 baud ready. Their BER numbers are horrible. Two radios
stand out as exceptions. They are the Azden 9600D and the Icom
IC820H. In both cases, modulation is done at a fixed IF rather than
in the synthesizer loop. Both radios are very expensive compared
to a TEKK, however.

> So, i am going to get a commercial two-band FM voice-capable
>rig. I read on a PacComm catalog that some old two-band radios, which
>don't have a 9.6 kb port, can be easily modified to get them
>working. They suggest to connect input directly to the varactor in the
>main VCO circuit of the transmitter and to obtain output from pin 9 of
>the receiver chip.

The main problem you'll have with that approach is that the synthesizer error loop will fight the modulation you're trying to apply. The only reasonable fix for that is to go to two point modulation. That's where you modulate the synthesizer reference oscillator as well as the VCO. That way, the PLL error loop won't see the modulation, and won't screw it up. This is *not* simple to do correctly. It is done in some commercial synthesized data radios, but IF modulation is preferred for synthesized radios.

You may get away with just tapping the discriminator directly in the receiver, but unless everyone else in your area is using low deviation, you'll probably still have a lot of phase distortion due to the IF filter.

A well engineered packet network should *never* require you to change frequency. You stay on your assigned LAN frequency so the network can easily find you, and let the *network* route your packets to people operating in other LANs. So crystal control is no handicap. And effective packet networks should be up 24x7, so dedicating a radio to the purpose is required. Thus trying to get dual use out of the radio for voice work is a moot issue. I strongly suggest that you abandon trying to get a voice grade FM radio to work for higher speed packet and instead get a proper data radio to dedicate to the job. If you do insist on converting a FM voice radio, consider converting a surplus crystal controlled Land Mobile service radio. They can be had inexpensively, and generally are very robust radios.

You don't use a TNC for Clover (or any other digital mode except packet).
HAL offers the P-38, which is a DSP plug in card for the PC, that does
Clover, RTTY, AMTOR, and PACTOR. It is about $400. They also have
an external box, the 4100, which is around $900. Unless you aren't using
a PC, I'd go with the P-38.

Hi,

I was asked today (by someone without Net access) how to clear the TX buffer in the Hamcomm program. I have not used Hamcomm for some time and then only in receive mode, so I wasn't able to help.

On test I found that this facility doesn't seem to work and after repeated attempts I gave up! There's nothing in the manual and, as far as I can see, nothing relevant in the config file (HC.CFG), so does any Hamcomm expert have any ideas? I've got version 3.0, by the way.

TIA,

Roger Basford

: engineering links with poor fade margins and consistently high loss rates.

Text book relay designs not only requires line of sight but it also
requires that the first Fresnel zone is clean from any obstacles in
all weather conditions. To keep the Fresnel zone clearance requirement
at a reasonable level, quite high frequencies should be used
(preferably below 10 GHz to avoid rain losses).

I did not take this requirement seriously, until I saw some long term
signal strength measurements in the UHF range with several receiving
antennas at various heights. The highest antenna had, according to the
path profile, a direct line of sight condition to the transmitting
antenna, although the lower part of the Fresnel zone had a lot of
obstacles. The highest antenna exhibited similar signal strength
variations, at a higher absolute level, as the lower antennas (which
did not have LOS). The worst variation I saw was about +/- 7 dB from a
stable value. So a 5 to 10 times power margin would be preferable.

Getting good RF paths would be prohibitively expensive.

: rather than imposing the cost of FEC on the whole network.

If the overhead is kept in the 30 to 50 % range, it is not a big deal.
You say that this reduces the net throughput, but OK, double the gross
bit rate. As this will also double the receiver bandwidth and to keep
the CNR the same, the transmitter power has to be doubled.

For real world environments, using FEC and double bit rate, double
bandwidth and double power will usually give a better throughput than
using the brute force method of simply doubling the power in the
unprotected non-FEC system.

In many fields of engineering, such as design of various magnetic and
optical data storage system, the trend has been for decades to use
clever coding to produce a reliable end to end data transfer using
unreliable media, instead of increasing the storage area to produce

inherently reliable storage mediums.

In our case, while designing double gross rate systems may be a hard
task, it is no big deal compared to obtaining inherently reliable RF
paths using brute force (high towers at short distances).

: IMHO it doesn't make sense to assume from the start that every link is going

: can be beneficial to the entire mobile network. I've been talking about fixed site
: VHF/UHF networks above.

I would take the opposite approach by assuming at least all end user
links to be mobile (and possibly also point to point relay links). If
by coincidence, some of these links would show very low raw error
rates, it would be time to reduce the power and/or reduce the amount
of overhead due to FEC. The "mobile" assumption makes sense in most
terrestrial cases, even if the station is not physically moving, the
atmosphere and other obstacles (such as trees, cars or aeroplanes) are
moving, changing the path constantly.

Seems to me that the easiest way would be to borrow a receiver from a
friend or store (if you're on good terms with the owner) and monitor that way.
Alternatively I'm sure it's no great feat to wire in a speaker/amplifier
combination to provide you with monitoring capability. Doubt if you'd be able
to tell much from this though. QRM usually refers to local interference,
local to the receiving station, so unless your using Pactor across town,
you'll probably be unable to hear the QRM that is interfering with your
signal.

Greetings

Have a serious think about ARCnet cards as well - lower bandwidth and
zero money (they can be found in rubbish bins).

ARCnet cards use a standard set of IO/IRQ and io registers so one
driver will suit all makes. Most come with both coax and balanced pair
interface so pretty easy to plug into a 10gig traffic light motion sensor!!

Just my (non-Euro) two pence worth...

When you connected the TNC did you remove the MIC or did you use the din plug on the rear of the radio? Most radios have the mic element hot so when you transmit on the TNC your mic is hot and any noise generated in your ham shack will be transmitted along with the digital signal. If you wired to the din plug on the rear, remove the mic next time you transmit on the TNC and see if the 'QRM' goes away.

4305. "NOSintro" *IS* still in print !!

Date: 1998-10-15 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <b0V6tOAN4fJ2EwYE@dowrmain.demon.co.uk>
Source record: 22135
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

I've just been listening to the realaudio presentation "Introduction to TCP/IP", given by John Ackermann, N8UR, at last year's ARRL/TAPR Digital Communications Conference in Baltimore.

His very clear and informative presentation was slightly marred, however, by his statement that the book "NOSintro -- Introduction to TCP/IP over Packet Radio" was no longer in print.

Gasp!

I'm pleased to say this wasn't and isn't true.

John is now working on his own book on TCP/IP, and it should be released Real Soon Now.

Meantime, if you want to find out more about "NOSintro", you'll find large extracts available on the web, at:

http://www.netro.co.uk/nosintro.html

4306. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <706dv1$oen@news.Hawaii.Edu>
Source record: 21998
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

4307. Need MFJ 1284 software !

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-16 00:00:00 UTC
From: Randy Fish <fish@microlink.net>
Message-ID: <01bdf8b6$fe094a80$7ddaa0d1@randyfis>
Source record: 21999

Hello All,
Name here is Randy in Kansas City, MO. N0SAH.
Would someone out there have a copy of the MFJ
software 1284 for the 1276 TNC?? My copy just
bit the dust. Could someone send this program to
me as a Zip-file attachment? Thanks 73
Randy N0SAH

4308. B.A.R.T.G. RTTY SPRINT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-16 00:00:00 UTC
From: bshort@speedchoice.com
Message-ID: <7F63689847516A17.B31D14DDF7692235.24388DBAA4003F99@library-proxy.airnews.net>
Source record: 22000

B.A.R.T.G. RTTY SPRINT. October 31st - November 1st,1998

TIME: 1200 UTC Saturday to 1200 UTC Sunday.

CLASSES: 1. Single Operator Expert * 2. Single Operator 3. Multi Operator 4. SWL * Any operator who has finished in the top ten of the single operator, all band class in any B.A.R.T.G. contest during the past five years, will be classed as "Expert" and must enter Class 1.

BANDS: 3.5, 7.0, 14, 21 and 28MHz Amateur bands. Stations may be contacted once on each band. Duplicate contacts on the same band must be clearly marked. EXCHANGE: Progressive serial number starting with 001.

MULTIPLIERS: All DXCC countries including JA, W, VE, VK and JA, W, VE and VK call areas, count as multipliers. Multipliers and continents count only once in the contest, regardless of band. No band multipliers.SCORING: Total QSOs x Multipliers x Continents (max 6).

LOG SHEETS: Use separate log sheets for each band. Logs must show BAND, DATE and TIME, CALLSIGN, MESSAGE SENT and RECEIVED, MULTIPLIERS and POINTS claimed. SWL logs must contain DATE and TIME of logging, CALLSIGN of station heard, MESSAGE sent by that station and CALLSIGN of the station being worked.

SUMMARY SHEET: FULL SCORING and POSTAL ADDRESS for correspondence must be shown, and in the case of multi-operator stations, the names and callsigns of all operators involved with the station operation during the contest. Any incomplete entries will be classified as check logs.

ALL LOGS MUST BE RECEIVED BY 31.12.98 IN ORDER TO QUALIFY.Please send your contest or check log to: JOHN BARBER GW4SKA, PO BOX 611, CARDIFF, CF2 4UN, WALES.or E-mail to: ska@bartg.demon.co.ukE-mail logs will only be accepted if sent as plain (or zipped) text files,with one file for summary and one file per band, named in the format,callsign.sum, callsign.10, callsign.15 etc.No BIN or other format files will be accepted. The judge's decision will be final and no correspondence can be enteredinto in respect of incorrect or late entries. Trophies will be awarded to category winners.Certificates will be awarded to the top ten stations in each class.

ADDITIONAL NOTES: Any contestant contacting 25 or more different countriesin the contest may claim the Quarter Century Award (QCA) issued byB.A.R.T.G., for which a charge of 6 dollars U.S. or 30 IRC's is made. Holders of existing QCA awards may add new countries to their existingrecords. A separate sheet showing bands, callsigns and countries claimedmust be included with the contest log.Your comments on the contest would be much appreciated.20th June,1998 (W6/G0AZT)

Of course the issues of subnetting, routing and backbones are completely
unrelated as everyone on the Internet knows.
What you need ia a good routing protocol, and your backbone link will
automatically get used when it is faster than your small hops.

From: f5pje@france-mail.spam.com
Message-ID: <362700db.2619987@news.wanadoo.fr>
Source record: 22002

>sorry to burst your bubble,m but it is NOT a tnc. You use this in
>conjunction with a tnc in order to use 9600 baud!..

The title was "packet MODEM with PIC". As far as I know, the module shown at http://web.avo.net/infracom/picrctg.html is a MODEM, and of course it needs a TNC.

For a stand-alone 9k6 solution, the answer is YAM from Nico Palermo, also available at http://web.avo.net/infracom/yamg.html : no TNC, just YAM on any serial COM port.

A new module, working like a BayCom-like module or like a real modem (+ TNC), should be available soon. It will use a PIC controler and have two diferent speeds (1k2 and 2k4) More information later as soon as possible...

Thanks Brian. I've already been in contact with them, and I agree.

Incidentally, if anyone here wants to find out how to start using PICs,
take a look at the article "Using PIC Microcontrollers in Amateur Radio
Projects" by John Hansen, W2FS, in this month's QST.

It is very clearly written, and includes detailed information on how to
program the chips, how to write programs, and a couple of working
applications (with schematics and code). An excellent introduction!

>I've had a license here for 37 years....I've owned it all and done
>it all. There is just no fun in operating any longer. Sorry to
>report but ham radio as it used to be died when the internet came
>along.

Perhaps this is taken out of context, but I have to take exception
to this type of thinking that I frequently encounter.

I do not beleive ham radio died. The internet can enhance enjoyment
of the hobby, but cannot kill it. Perhaps packet BBSs will die some
day with the availability of email, but amateur radio will survive.

For me, owning equipment is a necessary part of having a station to
operate, not the other way. No offense, but NOBODY can do it "all"
as far as amateur radio is concerned.

I can understand if operating on the air is no longer fun for you and
there are many who just homebrew or design etc and never really
get on the air, but this is distinct from the "death" of amateur radio.

I see some spending time with internet, but I think the amateur web
page design hobby is a passing craze. Not that everybody shouldn't
have a web page or whatever, but this like having a QSL card will
soon be taken for granted - it is a means to sharing information about
amateur radio, not a replacement for amateur radio, though there are
no doubt web page design hobbyists. The web page is a means
not the end for most hams, I think.

I don't bring all this up to just disagree, but what do others think?
How does amateur radio coexist with internet? I think trying to
ignore the internet is sure to fail, so what role is it to play? Surely,
some will be enticed to pursue it as a hobby, much as the introduction
of microcomputers 20 years ago, but in the long run, these computers
became a vital part of the ham shack. I view the internet the same way.

Amateur radio as I think of it is an awful big hobby to have done
everything.

73, Brian

It did for me. I still use 2m to keep track of a group of close friends locally but gave up on the HF bands years ago (and never moved up to General) because I wasn't strung out on collecting contacts. I wanted to TALK to folks, exchange info and ideas, but all everybody (it seemed) else wanted was a quick contact for a QSL. Answered a CQ from a YL living in the city I was born in. Appended a question to the usual QTH, Rig is, etc. but she was gone - to busy to even reply ....! Tinninitis makes code hard for me but I perservered til I was sure I could pass the 13 wpm test - only to find it'd been changed to suit the "QHT is, rig is then gone" crowd. I haven't had an HF rig hooked up for close to 20 years now and have forgotten most code. I may try again if the restructure gives me general priviledges but .....

I can see where you're coming from on your opinion. I've been a General for
25 years and I get very disgusted with the immaturity that goes on 40
meters, especially in the evening hours. It sounds like they are grown men,
but they are real jerks, and are ruining our hobby. I've been using
Vocaltec's Iphone 5.0 on the web (with video and voice) and have been
talking all over the world. The sorry thing about it is, there is an awful
lot of jerks and perverts there too.
Again this is my opinion. 73's

The internet didn't kill ham radio for me, it just makes it quicker and easier to get information related to ham radio. There's lots of things to do on HF besides rag chewing; digital modes, slow scan, etc. I enjoy tinkering and building and that's ham radio too. I've never tried I-phone but I can't imagin that talking over a pair of wires rented from the phone company, via a computer purchased in the store, using software written by someone else could be as interesting as working around the world with a QRP rig and antenna you build yourself.

> 73, Brian KE7GH

I see that you are 39 years old Brian. By reading your post I would have thought you much older. Most of the hams I QSO are over 50. That should tell you something. There is not enough young people entering the hobby. One big reason IMHO is the internet. Why memorize a multiple guess test and study the code just to buy radios and yak on the air, when you can have all that and more on the internet. Further learning computer skills is valuable. I can't remember the last time I talked to a guy that had built his rig, or unless he is in the business knew how it worked. Teenagers these days are some of the best hackers. If the internet were around when I got started in 1957 do you think I would have been studying the code?? Not on your life. *Ham Radio* is not dead. The ham radio I knew in my youth is almost dead. The present day ham radio of communication ops will slowly evolve toward a CB type citizens radio. I don't think easier or no code tests will stop or enhance the trend. And I'm not sure it's bad. When I was young the government looked on ham radio as a ready pool of electronics types if needed in an emergency. That's laughable today. Today our computer savvy is what keeps our nation productive so the more young people that swing that way the better.

> Today our computer savvy is what keeps our nation productive so the more
> young people that swing that way the better.

But what happens when there is a disaster and the phone lines are knocked out. How does computer knowledge help then? Actually, many of the computer savvy people today are software types only. They don't have a clue about the electronics inside the computer. If it quits working you take it back to the store where you bought it. Kind of like being considered an automotive expert because you know how to drive a car.

Al,

"Ham Radio as it used to be" died when....

...the Bureau of Navigation started requiring hams to have licenses
...the Navy succeeded in banishing us to 200 meters and below
...spark was outlawed
...phone came along
...Novices were created
...they gave 20 meters to the Generals
...SSB came along
...incentive licensing came along
...repeaters got popular
...Novices were given voice priveleges on 1296MHz
...No-code licenses started
...Barry Goldwater died

...whatever pseudo-tragedy you wish to blame it on......

> I have always been a ham of extremes....1961 1KW Am station, 1963 1Kw
> DSB station (1000w carrier modulated with 4KW of audio) It was the
> strongest radio signal coming from the US on any band worldwide. 1970
> 10Kw SSB on all bands......

Given that record of flouting the rules, perhaps it's a good thing
you've decided it isn't fun any more.

I don't think that the fact, and I do accept it as fact, that there are amateurs
who lack the equipment, or the skills, to properly setup a data link should be
used as an excuse to mute discussion of this topic. It is important if you
hope to get decent BER performance with voice grade FM radios.

>> In the Mastr II, the IF fillters have too much phase distortion near the passband

>frequency stability. Sure, there's a bit of an SNR loss here, too, but you're
>not going to have much luck at 9k6 without fairly strong signals in the first
>place.

Do realize that the G3RUH modulation is intended to be GMSK. That means
the deviation must be precisely 2.4 kHz. A lesser deviation increases ISI
dramatically, and a greater deviation balloons occupied spectrum. But even
with the deviation set correctly, the phase non-linearity of the IF filters of
many of these radios will adversely affect BER.

It is a myth that you need "pin the needle" signals to do 9.6 kb. If you set things
up correctly, signal levels on the order of 5 uV are plenty. But you can't be
slapdash about it. You must attend properly to all the details. Even at pin
the needle signal levels, many amateurs are seeing dreadful BER with their
maladapted voice grade radios. Once the signal is garbaged up, more garbage
doesn't help matters.

>> The discriminator used in the Exec II and Mastr II is a bit odd. It is not zero
>> center. You have to remove the 2.5 volt DC offset before feeding the modem.

>
>Huh? The 9k6 modems I've looked at use large-value coupling capacitors
>to block DC at the input, which should do the trick in most cases, and is
>much better than using an op-amp (which would be a DC drift issue).

Even with a scrambler for spectrum whitening, there is a good deal of
slice point wander with AC coupled signals. There's about a 5 db difference
between DC coupling and AC coupling with a 5 Hz corner frequency. Low
drift opamps are available for under a dollar, as are precision DC references.
If that's what it takes, that's what you use. But as noted, it may be better
to avoid the issue by using a IF strip designed from the get go for data.

>I'm not sure what would be the advantage of tossing the entire IF strip and
>engineering one from scratch. If you're interested in IF strip design, I guess
>that would be good experience, but if you're interested in 9k6 operation
>this would be worse than a waste of time.

Since you can fairly easily gain up to 10 db of link margin by using a designed
for data IF strip rather than the IF strip typically found in ex-land mobile or
amateur voice grade FM radios, I think it is far from a waste of time. That's
the equivalent of being able to use a 10 watt radio where a 100 watt radio
was required before. I'd consider that significant, especially if the transmitter

is at a remote site depending on alternative power sources.

Hi,
Sorry to hear you gave up on HF ham radio. I have been using HF for
43 years now, and I am a ragchewer, DX or local. All on CW. There are
thousands of excellent ops out there, worldwide, who enjoy ragchewing.
I ragchew with stations, including DX (a lot of JA's) from my car, CW
mobile, in the mornings on the way to work. Sometimes I continue a QSO
with the same station on a subsequent day.
There are a LOT of different kinds of folks out there on HF. Too
bad you threw in the towel so long ago. Take another look, especially
on CW. Lots of ragchewing going on all the time.
I too cannot see how the Internet could ever replace ham radio for
me. I have been using the Internet for over 14 years now, since long
before it became commercialized. Direct person-to-person operating on
HF is a completely different thing than "using the Internet". The
former relies on operator skill and technical curiosity and interest,
and the latter is merely another communications and information
gathering tool, with none of the magic of radio. Apples and Oranges.

Hi Gary (via David) OM,

Balderdash. I have been using an SB-220, driven by a TS820 (nice FSK rig by the way, with two 4pdt relays in it) for many years on AMTOR and PACTOR. Both are stock, although I did insert a resistor in series with the t/r keying relay coil in the SB-220 to reduce the inrush current to the relay contacts in the TS820, and I mounted the T/R relay in the SB-220 on isolation foam to reduce acoustical noise. I hear all the time from ops I am working on the air such things as "relay rigs cannot run TOR", and "any amp needs a PIN diode T/R switch", etc etc.
Then they are surprised when I tell them what they are listening to. Most relays are plenty fast enough for the 15-20 mSec required by TOR for worldwide DX. I have measured the TX and RX timing on my TS820 and it switches in under 15 milliseconds, plenty fast enough. The SB-220 switches in under 8 mSec.
Do not believe advertisements for QSK switching hardware, and do not believe others who have opinions not based on any technical knowledge or measurements.

Alan OM,

Balderdash. I have been running a TS820 (an excellent FSK rig,
by the way) with a Heatch SB-220 amplifier for over 14
years on AMTOR and PACTOR, with many thousands of hours of
operating time. They work fine, and the combo switches
in under 15 milliseconds by my measurements, plenty fast enough for WW
DX on TOR.

Mev OM,

Just connect the audio input to your controller via a phone plug into
the phone jack on the receiver. Do not push it in all the way, just
make contact with the center pin on the plug. I have been doing this
for many years (decades). The demodulator in the controller has
sufficient gain to pick up the signal off of the phone jack without
disabling the speaker. You ALWAYS want to be listening to the other
guy's signal, of course, so you can determine the condx and identify the
need to QSY if QRM pops up, same as you do with any other mode.
Naturally, none of the manufacturers have any of this useful info in
their manuals. My theory is that they are not experienced
operators/users of their own equipment.

Ironically, the MF10 filter circuit in the TNC2 twists the wrong way,
so instead of just 6 db of twist, you get 12 db of twist. Those of us in
the know bypassed it and saw an immediate improvement in BER.

(Tone twist is a telco term having to do with DTMF high group and
low group tones, for us radio folks it is just pre-emphasis and
de-emphasis. For data, you don't want any.)

+/- 7 db is actually a pretty good link. Telco designed in a 40 db fade
margin for four nines, but we don't need that much. We can tolerate
a fade out occasionally when the inversion is really strong. 20 db of
fade margin is what I use when figuring amateur link budgets.

>Getting good RF paths would be prohibitively expensive.

Not really. In most cases, amateur VHF/UHF links are strong
signal links with lots of margin. Drive around and kerchunk some
repeaters to get an idea of the sort of paths amateurs typically
use. There are some places we don't try to go, of course. We
aren't the phone company, universal service isn't mandated.

>the CNR the same, the transmitter power has to be doubled.

A 50% FEC overhead is equivalent to a naked ARQ protocol that
has to retry every packet once. That's a *lousy* link. We have regulatory
bandwidth restrictions on VHF and lower UHF, and it is to our advantage
to make the most of that bandwidth by filling it with data rather than FEC
overhead.

>For real world environments, using FEC and double bit rate, double
>bandwidth and double power will usually give a better throughput than
>using the brute force method of simply doubling the power in the
>unprotected non-FEC system.

It might, but it is also likely to be cheaper and more effective to double
antenna gain on each end of the link instead. Or simply to boost the
power from 10 watts to 100 watts and pick up 10 db of margin while
still using the available bandwidth to maximum data capacity.

>In many fields of engineering, such as design of various magnetic and
>optical data storage system, the trend has been for decades to use
>clever coding to produce a reliable end to end data transfer using
>unreliable media, instead of increasing the storage area to produce
>inherently reliable storage mediums.

True, but those media have saturation limits that don't apply to spectrum.
We have the option to boost ERP to nearly unreasonably high levels if
we desire, and we have access to many high sites. That's not always the
right answer, of course, but on a tightly focused point to point link it often is.

>In our case, while designing double gross rate systems may be a hard
>task, it is no big deal compared to obtaining inherently reliable RF
>paths using brute force (high towers at short distances).

Think tall buildings and high hills. The same sorts of places we locate
voice repeaters also serve nicely for data link sites. And we generally
already have access to them.

Now I've been rather contrarian in this thread. Of course there *are*
situations where low power and nap of the Earth antennas are
going to require us to use FEC. But in many many cases in the US,
that's not the right approach. If we can engineer even a two nines RF
link, and we very often can, then that will almost always win out. That's
because in the real world a 99% link doesn't drop one bit in one hundred,
it drops a string of 1,000 bits every 100,000 bits, or drops 100,000 bits
every 10 million bits. That's a different kettle of fish. The vast majority
of the time, the FEC is dead weight. The few times it might help, we
can tolerate the outage.

As I noted in another post, contending with military radar is an exception to
this, it does knock holes in most of our packets, and FEC is the right way to

fill those holes. HF is another obvious exception where skywave multipath punches holes in even megawatt ERP signals. But the vast majority of VHF/UHF paths are relatively stable except for periods of strong inversion. Those are infrequent enough that we can live with them.

Well, we all know that names are not routes, and in theory addresses
are not routes either, but in practice we have to make some concessions
to topology. The world isn't one big ethernet. You are right that what we
need is a good dynamic least cost routing protocol. But in networks
where routing information propagates slowly while link quality changes
dynamically, that's a hard thing to do.

As an old ham,(47 years old, licensed ham for 32 years) I can relate to this thread. I "discovered" the internet a few years back and let ham radio fall by the wayside. To me the fun of ham radio was the challenge of making contacts. When I got my novice license, I was limited to cw, crystal control, and it was only a 1 year license. My first rig was a converted ARC 5 xmtr and a BC348 receiver. With only one crystal for the 15 meter band it was a challenge to make a contact --with anybody. As time went on, rigs got better and better and making contacts got easier until it got run of the mill to work whoever or wherever you wanted. Almost as easy as dialing a telephone.
Also, my main source of fun was tinkering with the equipment, building, modifying etc and the new rigs got so complicated with all the bells and whistles and so miniaturized that the average ham couldn't fix his own rig. We hams became appliance operators. Now, my fun with computers lies with building, tinkering and upgrading, my internet surfing usually is on the hardware newsgroups.
I am currently getting back into hamming, I bought a QRP rig and am working CW almost exclusively with a simple wire antenna..part of the challenge is there but its still not like the old days. I know very few young hams, most are old farts like me. If ham radio has a future 20 years down the road I don't know what it will be.
Another of my peeves is the cost of new gear. Computer gear has gotten dirt cheap but ham gear just keeps going up. Just an "entry level" station will set you back a couple of grand at least. I'm using a computer power supply to run my QRP rig...the 12 volt connection is rated at 10 amps...I paid 15 bucks for it new at the local computer shop. A 12 volt 10amp power supply from a ham radio outlet is about $100. It would be hard to spend over $2500 for a top of the line computer but a top of the line ham transceiver, antennas and accessories easily can go for $10,000 Of course part of the difference if there are a lot more computers sold making the costs lower, but the ham equipment manufacturers aren't hurting any.
Thanks for the soap box to air my 2 cents worth...

Hello Everyone,

> Have a serious think about ARCnet cards as well - lower bandwidth and
> zero money (they can be found in rubbish bins).

If someone wants to fiddle with converting ARCnet card, then I would be happy to give them some. This is only for serious interested parties. I believe I have 3 - 10 down in the basement. They are Tomas Conrad cards.

It would be alot more useful to have the cards destroyed by someone fiddling (or who knows, maybe even make work =) then it is for them to gather dust.

I don't think that any discussion of this topic should be muted. I think it should be put into perspective. I never said you were wrong. but I think you're running a serious risk of unintentionally misleading the less experienced.

C'mon, that's a gratuitous dodge ;-). Just as easily as you say "build your own IF strip" you can include a reminder for those prone to "mod-itis" - "don't start making mods like this until you've made sure everything else is in order".

I happen to have Miller's paper right here ('9600 Baud Packet Radio Modem Design',
ARRL 7th CNC Proceedings). Nowhere in that paper is GMSK mentioned; in fact,
the primary unique feature of the G3RUH modem, according to G3RUH, is the
implementation of transmit-waveform amplitude/phase shaping to compensate
for receiver imperfections. Nowhere is the mentioned of precisel 2400Hz deviation,
in fact, +/- 3KHz is used in describing channel width. Are you reading a different
paper by G3RUH?

Did I say 'pin the needle'? I said 'fairly strong signals', and I'm describing
something quite practical - allowing some margin.

Let's have a look at the MX589 GMSK application note - this exact topic
is discussed. Indeed, they suggest DC coupling is best, but that AC coupling
with a -3dB frequency of under 20Hz is suitable. Dinking around with an
opamp to produce a DC offset is less practical and more prone to error than
just using a 1uF (or larger) coupling capacitor to a high-impedance input.

For what it is worth, the G3RUH modem you mention happens to use a .1uF
coupling capacitor in the RX audio input path, giving a -3dB frequency
right around 20Hz. Again, dinking around with the discriminator output
to 'fix' the DC offset is liable only to make things worse, never better.

> is at a remote site depending on alternative power sources.

Let me rephrase - if the average 9600 baud experimenter ends up concluding they need a new IF strip, they're far better off finding a working radio with a more suitable IF strip. Building up an IF strip from scratch might be good experience but it is also liable to be a major inhibitor to someone more interested in packet experimentation than building receivers. That's why I call it worse than a waste in time.

I'm not disagreeing that IF response is important, but I'm pointing out that several of the things you describe as important are either less important than numerous other basic factors - or outright specious. You've convinced me not to use a Mastr II for 9k6 - which is something I suggested in the first place. A grungy old Flexar (Maxar in a desk console) or a Mitrek makes an excellent 9k6 radio with virtually no modification, it just seems ridiculous to be talking about building IF strips from scratch by comparison. The Mastr II front ends are strong, but everything else about them (PM and, as you describe, poor IF response), makes them a poor choice for 9k6, plain and simple.

Yes, a KAM and an older Heath scope should work just fine for tuning RTTY. Unfortunately, for some reason the Kantronics factory has chosen not to make connecting an oscilloscope Plug 'n Play, but it isn't too hard to do it yourself. Here is a copy of an email I sent to another fellow some time ago describing how to make the connection:

The procedure is essentially the same for all KAM versions, but there are slight differences in the layout of the pc board. Basically what you do is to install two jumpers (just plain insulated wire) and two 100k ohm resistors, one is series with each wire. I'll just describe what needs to go where and you will have to figure out exactly how to do it depending on your particular version.

After you remove the cabinet, you'll see a pair of pads on the board near the front and off to one side marked MA and SP. The MA has to be connected through a 100k resistor to pin 11 of the DB-25 connector, and the SP likewise through another 100k to pin 18. The difference between versions is in exactly how you do that. (I'm going from memory now, so cut me a little slack here). On later versions, you can trace the wiring back from pins 11 and 18 to the board, and you'll find a place to install the resistor right on the board. On older versions, there isn't a place directly on the board, so you'll have to kind of suspend the resistor in mid-air where it connects to the jumper going to MA or SP. However it mounts physically, the electrical connection is the same. You'll also need a ground connection to the scope which you can either make to the ground pin on the DB-25 if you don't mind having two wires at one pin, or you could run it to any convenient point on the chassis, such as a screw on the connector, or you could add a nut and bolt somewhere on the back panel.

After doing all this, you just connect the MA output to the X input on your scope and the SP to the Y input. The output is about 1 volt p-p,

so set your scope's input sensitivity accordingly.

As the KAM manual points out, the 100k resistors are not absolutely necessary (you could just have a jumper wire direct) but they serve as protection to the KAM in case any voltage is accidentally applied to pin 11 or 18. If you're absolutely sure that will never happen, eliminate them and just install the jumper direct. Personally, I put them in just to be safe, although I can't imagine how voltage would EVER get applied there. Murphy is alive and well, though....

Good luck, and if you need more help or information, let me know.

73, Bill W7TI

> Just an "entry level" station will set you back a couple of grand at least.

Wow!! James, you've got expensive tastes!! After 35 years of hamming, I recently moderated my tightwad ways and spent $2K on what I thought was a top of the line rig. Now you break my heart and tell me I'm at entry level!

> I'm using a computer power supply to run my QRP rig...the 12 volt connection is rated at 10
>amps...I paid 15 bucks for it new at the local computer shop

Hmmm... You say it costs $2000 to $10000 to get equipped in the ham world, but at the same time you're having fun with an inexpensive QRP setup. Make up your mind--which is it??

Personally, I'm amazed at how cheap ham stuff is, especially since it doesn't have the mass market of computers or stereo equipment.

I could get a rig that covers 160 thru 2 meters running SSB, CW (keyer built in), FM, AM, general coverage, very compact ... for about $800 used or maybe $1100 new. Try that in 1965 or 1970.

But if I were just entering ham radio, I probably wouldn't spend that much. I'd get a pretty nice rig for <$500 have plenty of fun with it. I recently sold my wonderful Corsair for $350 after 10 years of great performance so I could buy that dream rig (entry level to you).

I think it's a non-issue. nothing can be done to change it so why stress? I'm sure a lot of people felt that reading books by candle-light lost it's "character" when Edison came along. But who cares? I sure don't. My HT is still right where I put it last night...the internet didn't make it disappear. I don't love radio because it's radio, I love radio because it's the best way we know of to communicate wirelessly. If I came across some other new-fangled method of getting the job done, I'd sell my radios as fast as I could before other people find out about it - in other words, radio is a means to an end.

God, I can't think of anything more boring than "collecting contacts". I have
no idea why hams are generally considered boring people....Maybe that's why
peope do DXpeditions, they're tired of collecting contacts so they just get up
and GO somewhere (and they take their radio too).

hmmm...all this talk of the nastiness of HF...I'm a tech+ right now, do I really want to spend the time to upgrade so I can buy a $2000 HF "flame war" machine?

> emergency procedures and alternatives.

As long as everything is working acording to plan. If you're not an electronics expert then what do you do when something goes wrong? Wait until the local Radio Shack store reopens I guess. What you need is emergency proceedures and alternative PLUS some electronics expertise.

> Again, the knowledge needed in an emergency is operational and only rarely
> might electronics knowledge be a needed skill.

and only rarely is any emergency equipment needed in the first place but that does not mean we should not concern ourselves with emergency planning. The bottom line is that the ham with an HF rig, some sort of emergency power and enough electronics savvy to put it all together and make it work will be the best prepared for emergencies. The people with only computers and cell phones will be unable to communicate with anyone. Even VHF will be very limited without the supporting repeaters.

> But there are auto experts that I wouldn't ever let drive any of my cars...even

By the way, the discussion on this thread takes place on a regular basis in a government agency I work with. The higher-ups are always wondering why, when we have cell phones and a computer network, do we need to be spending money on a radio system - especially an "antiquated" HF radio system. Funny thing - nearly every time a hurricane hits they all all communicating via HF radio because its the only thing that still works. Another funny thing - they always need that electronics technician to string an antenna somewhere, decide which frequency to use, and get everything up and running for them.

Mobile flutter (multipath) would be a problem, but as I noted, very few
of our packet network links are mobile. We do have some experience
with this, however. Dale runs 56 kb from his car. As long as he doesn't
stop in a null, things are good. In motion, of course, the picket fencing
can be bothersome, and FEC does help with that.

Ok, I buy that. But my contention is that is rarely the case.
We can usually engineer a better link, or find an alternative
route.

>throughput by reducing retransmissions.

Yes, we can use symbol overloading to increase the bit to baud ratio,
but of course that costs us in terms of Eb/No. When the impairments
are primarily picket fencing or impulse noises, that may be a good
tradeoff. But when we are operating near the gaussian noise floor,
as might be the case on a long obstructed path, we might prefer to
retain the extra SNR margin.

>: It might, but it is also likely to be cheaper and more effective to double

>issue.

That's true. In those cases it is probably more economic to add another
relay node to the path. My feeling here is that striving for Dx in network
links is generally not a good plan. It forces you to work closer to the noise
floor than is desirable, and it opens you to a number of channel impairments
which wouldn't be bothersome with a shorter path and hence a better link
margin.

Point taken. Flatlanders in the middle of our country face a similar
problem, many miles to span and few high points for relay sites.

>: Now I've been rather contrarian in this thread. Of course there *are*

>interleaving will also increase the latency, so there is a limit for
>interactive applications.

This is where long term path studies are useful. From the statistics
I've gathered here, that sort of situation is not common. We often go
long periods without a single bit error, then occasionally we may suffer
a complete outage for hours at a time as a strong inversion forms.

>IMO, the FEC issue should be handled in a similar way as automatic
>power level control, if the raw bit stream is of high quality, the
>amount of redundancy should be reduced and if the number of corrected
>bit errors increase or if there is an uncorrectable error, the better
>FEC should be applied and the situation monitored for a while to see
>if the overhead can be reduced.

Another approach would be to use a punctured coding. That way we
always only transmit as many bits as are needed to get an error free
packet. I think Karn had something like that published in one of the
CNC Proceedings. This does require a new link level protocol, but
throughput costs are low and potential benefits in some situations
might be large enough to warrant the switch.

Lucky for the sailors aboard our merchant ships, the FCC disagrees with
you. In the past, to get a job as a shipboard RO, one had to pass a
rigorous exam testing the student's electronics expertise.

Whether it be the maritime or amateur service, segregating operating
and electronics knowledge should not be encouraged.

I was the one who originally suggested that many linears have such problems.
Since I don't run an amp, but have had friends with problems running even
CW semi-QSK with the SB-220, I have to think that you have a fortunate
combination of relays and rig. Using an Omni for example, one friend
went crazy with the slow response compared to no amp for both pactor
and cw. The relays didn't stay closed but rather bounced detectably on
a scope, for about 200-250 milliseconds. That screwed up not only the
beginning of characters sent, but also the beginning part of most characters,
and the ack required didn't work either. Using a QSK article on the
SB-220, we were able to get the thing to work properly with the time spent
bouncing about 75-100 milliseconds. I suggested the Ameritron/MFJ
QSK kit because it's available and has many of the bugs already worked
out supposedly (Yes I know of the complaints about MFJ gear), it seemed
like the best option to suggest to me. BTW if you know, what's the
bounce time on your relays, I suspect that without modification they're
at the low end, which is why they work for you.

> breakdown.

I don't know where you have been, but there is overwhelming evidence from the past 10 years that Ham radio remains the most reliable form of communication in a significant disaster, and none worth mentioning that any other communication system is close to its equal.

We surely could do a whole lot more to improve the system, and surely do not want to restrain the development of other systems, but it is plain that Ham's design systems with redundancy, ease of repairability, backup power options, and alternatives ... something commercial systems have a real hard time justifying in their competitive circumstances.

Anyone paying attention noted that the Internet failed in almost every case where Hurricanes were in the area this past Hurricane season. Neither the Internet nor the Cellular phone infrastructure is designed to survive major disaster (though that was once a part of the purpose of the early Internet).

I think that the FCC should authorize the development of a 20-40-80m Amateur high speed digital radio link system to serve as the information and coordination HF-direct backbone during emergencies, that this system should be tested monthly with simulated disaster conditions to evaluate potential weaknesses, and that exceptions should be made to regulations to assure that this system is effective (band segments, the priority assignment of specific frequencies for tests and actual declared emergency activity, power levels). Intentional QRM should be immediately and aggressively prosecuted with mandatory fines, license loss, jail time, public service and confiscation of gear -- it is a very public interest to assure the integrity of emergency and disaster communications. (Interference from other countries shold be responded to at the highest levels with agreed upon proceedures to report and discipline QRM'ers within minutes. It is worth of note the a Net out of Spain with more than one member clearly running illegal power QRMed the Hurricane Net on more than one occasion during the latest season, and selfishly refused to relocate

when informed of the emergency nature of the situation.)

I also think that the license process should be modified to include a significant increase in required knowledge of digital communication rules, technology and purpose.

IMHO ... :-) ... 73, DavidC AA1FA

No... $2000.00 is "entry level" when compared to a brand-new /\/\otorola
MICOM-2R ruggedized, milspec HF set with ALE
(Automatic Link Establishment), at $6500.00+ :-)

But then again, the MICOM-2R is fully type accepted for commercial use
and doesn't have to be "modified for out of band operation" ...

1.6-30 MHz in 10Hz steps, fully tunable for frequency from the
front-panel
Full DSP on transmit and receive, four selectable filters for both
transmit
and receive 2.4 KHz, 3.0 KHz, 500 Hz CW filter centered on 900 Hz, and
a 500 Hz low-speed data filter centered on 1800 Hz, digital
noise-blanker,
and digital syllabic squelch. The set is fully ARQ capable with a
dedicated
remote connector for a TNC..

Top of the line ham gear like the ICOM's with spectrum display can
also run about the same amount... $6000.00+

After reading the postings here on the "Internet vs Ham radio", I am
wondering why this issue is defined as "either/or". Ham radio and
the Internet are different animals and they both have their place.

I think that viewing communications as a tool kit of various
methods is better than getting into heated discussions as to
whether "The Internet is 'better' than ham radio" or vice-versa..

For example, I was part of a FEMA sponsored emergency exercise
here in the Silicon Valley area a few weeks ago and our San Jose
RACES unit was a major component of this exercise. Our operators
(including myself) were tasked with the job of shadowing the
exercise evaluators and observers and providing a comms network
so they could all communicate with one another.

Just because I was "RACES", did not prevent me from handing out
City-issue
handie-talkies that are on our City Channels, nor did it prevent me
from using either my City-issue Cellphone or my own cellphone in
order to get messages through to others.

Just like in "The Real Thing", you use all communications means
at hand and not limit yourself just to ham radio. In fact,
our State Office of Emergency Services considers "ham radio"
as part of a larger-scope context called the "Auxiliary Radio
Service" (ACS), and pools all of the resources of many types
of services together. They all have their place whether it is
ham radio, Internet, National Guard, State Military Reserve,
Red Cross, Civil Air Patrol, ARES, RACES, MARS. Caltrans, or other
services..

FWIW, just my $.02...

It's only a matter of "Thinking outside the box" :-)

Could you be a bit more specific, Joe? Actual actions which you felt
took place, dates of such activity, results of such actions - those
sort of items would be helpful to back up your accusations.

In a major power down emergency wouldn't repeaters also be out .
How many HF rigs are on the ready with battery and or generator power, very few would be my best guess.

In addition, with fewer and fewer CW ops, I wouldn't rely on that mode either. Online services via cellular could very well be the more reliable means to get infomation out to the populace in antthing less than a national power breakdown.

Ofcourse we could all just learn to communicate via drums.

Hi folks!
If you come over to my homepage and navigate your way to
the radio section and then go to the links you will find a great
completely free Anti-Virus program. The program has just had the
string definitions upgraded as of October 12, 1998. This will cover
all the terrible new trojans that have popped up over the summer.
Please feel free to explore all the other stuff that is non radio
related. Also, the Aussie HAP charts are a great propagation tool.
Take care, and I look forward to working you on the air.

That would depend on whether you owned an automobile or not. In a pinch, a car will power an HF rig and perhaps a few VHF/UHF radios as well.

You should revise your estimate from "very few" to "almost all".

Also, old 386 laptops can now be had for very little, if money is a big problem. The original battery pack may be dead, but most of these old computers can be run from a cigarette lighter plug in the car.

My emergency operation "kit" consists of a spare set of power leads for the HF rig. I figure it would take me about fifteen minutes to disconnect the rig in the shack, toss the coax outside the window, hook up the rig to the battery in the car, and drag the coax over so I could hook it the thing up and start operating.

We've got it really easy compared to what guys had to do back when they used tube radios.

wrote:

: On Thu, 15 Oct 1998 20:00:40 GMT, keinanen@sci.fi (Paul Keinanen) wrote:

: >Getting good RF paths would be prohibitively expensive.

: Not really. In most cases, amateur VHF/UHF links are strong
: signal links with lots of margin. Drive around and kerchunk some
: repeaters to get an idea of the sort of paths amateurs typically
: use. There are some places we don't try to go, of course. We
: aren't the phone company, universal service isn't mandated.

While this proves that the signal level is quite acceptable on
average. However, you are comparing apples with oranges when comparing
speech, with a lot of redundancy, to non-FEC digital data transfer.
For instance mobile flutter does not usually degrade the readability
very much, but would be quite catastrophic for non-FEC digital
transmission. However, FEC coded and properly modulated signals should
give similar coverage as NBFM with similar power levels.

: >If the overhead is kept in the 30 to 50 % range, it is not a big deal.
: >You say that this reduces the net throughput, but OK, double the gross
: >bit rate. As this will also double the receiver bandwidth and to keep
: >the CNR the same, the transmitter power has to be doubled.
:
: A 50% FEC overhead is equivalent to a naked ARQ protocol that
: has to retry every packet once. That's a *lousy* link.

Yes, this is a lousy link, but if it is the only one available at a
reasonable cost, then it is definitively worth using it.

While a 50 % data rate drop is certainly felt in interactive
applications, a 30 % drop is not always felt. An old rule of thumb for
computer applications is that it is not worth improving the response
time by only 10-30 %, since the user will not notice it anyway, but
the improvement has to be at least 50 % to be noticed without a
stopwatch.

I personally prefer to use applications that works smoothly, although
with a somewhat reduced rate than tolerate the jerkiness due to
frequent ARQs. For batch data transfers, large packets are preferable
for good throughput, but this increases the block error rate and also
retransmission times, so even in this case it is not a very good idea
to send unprotected data. IMO, the number of retransmission should be
avoided at nearly all costs and this applies especially to simplex and

half duplex links.

: We have regulatory
: bandwidth restrictions on VHF and lower UHF, and it is to our advantage
: to make the most of that bandwidth by filling it with data rather than FEC
: overhead.

While there are bandwidth or baud rate limitations, I do not think
that you have raw bit rate limitations. I think that it should be
seriously considered going from two level non-FEC to four level FEC
with up to 50 % overhead, which would keep the baud rate and bandwidth
the same. At least in some environments this would increase the net
throughput by reducing retransmissions.

: >For real world environments, using FEC and double bit rate, double
: >bandwidth and double power will usually give a better throughput than
: >using the brute force method of simply doubling the power in the
: >unprotected non-FEC system.
:
: It might, but it is also likely to be cheaper and more effective to double
: antenna gain on each end of the link instead. Or simply to boost the
: power from 10 watts to 100 watts and pick up 10 db of margin while
: still using the available bandwidth to maximum data capacity.

While going from an omni to a short yagi or going from 10 W to 100 W
with a standard brick amplifier are cost effective means of improving
the margin by 10 dB, the next 10 dB improvement would cost quite a
lot. Finding a reliable 1000 W amplifier for 24x7 operation is quite
hard and expensive. Even the cost of electricity is going to be an
issue.

: >In our case, while designing double gross rate systems may be a hard
: >task, it is no big deal compared to obtaining inherently reliable RF
: >paths using brute force (high towers at short distances).
:
: Think tall buildings and high hills. The same sorts of places we locate
: voice repeaters also serve nicely for data link sites. And we generally
: already have access to them.

Unfortunately, the plate tectonics (and the last ice age over here)
has not always been too helpful in providing suitable high places
between cities :-). While high structures are in or near the cities,
they are suitable for repeaters and nodes for local users, but these
high structures do not help much for long distance communication,
unless the next city with high structures are within 50 km.

:
: Now I've been rather contrarian in this thread. Of course there *are*
: situations where low power and nap of the Earth antennas are
: going to require us to use FEC. But in many many cases in the US,
: that's not the right approach. If we can engineer even a two nines RF
: link, and we very often can, then that will almost always win out. That's

: because in the real world a 99% link doesn't drop one bit in one hundred,
: it drops a string of 1,000 bits every 100,000 bits, or drops 100,000 bits
: every 10 million bits. That's a different kettle of fish. The vast majority
: of the time, the FEC is dead weight. The few times it might help, we
: can tolerate the outage.

Unfavourable meteorological conditions do indeed drop the signal level
below usable and no interleaving+FEC can cure this situation.

However, there are several other situations in which either the signal
level drops or the interference level increase, causing short burst
errors, which can be corrected by using interleaving to distribute the
burst error to random errors and then apply FEC. However, a too long
interleaving will also increase the latency, so there is a limit for
interactive applications.

IMO, the FEC issue should be handled in a similar way as automatic
power level control, if the raw bit stream is of high quality, the
amount of redundancy should be reduced and if the number of corrected
bit errors increase or if there is an uncorrectable error, the better
FEC should be applied and the situation monitored for a while to see
if the overhead can be reduced.

I fully agree that high quality RF paths should be used whenever
possible, I don't thing that there is any disagreement about that.
Unfortunately, there are some minor details, such as cost, getting
suitable site permissions and maintainability may force to search for
other options.

> Do not believe advertisements for QSK switching hardware, and do not
>believe others
>who have opinions not based on any technical knowledge or measurements.
>
> 73,
> Don, W6JL

Hmm, did I say that you can't QSK with relays? I don't think I did.

Lets look at the timings involved with AMTOR. The information sending
station (ISS) transmits a triplet of characters in 210 ms. The information
receiving station (IRS) sends a 70 ms ACK or NAK in reply. The total
time for this cycle is 450 ms, so there is 170 ms of slack in the system

to allow for 2 TR switching times, 2 receiver recovery times, and the signal round trip time. RTT to the antipodes is about 12 ms. So you have about 84 ms to do TR and allow the receiver to recover (or the transmitter to ramp up depending on what part of the cycle you are in).

Now most relays can easily switch in a few milliseconds (typically about 8 ms for open frame power relays), but many will also have contact bounce that can last significantly longer than the initial switch time. It is not uncommon for open frame relays to bounce for 50 to 100 ms after the initial closure. This does two bad things. On receive it can pump the AGC, slowing receiver recovery, and on transmit it can allow contact arcing to occur. That may not damage the transmitter, but it can drastically shorten relay contact life.

There are relays which can do significantly better than this. Jennings vacuum relays are an example, but some open frame relays qualify too. If your relays can switch and settle in under 20 ms, the receiver should have time to recover, or the transmitter will have time to ramp up, in the timing window provided by the AMTOR protocol.

It should be noted that receiver recovery time is not a negligible portion of the time allotted. Some receivers take in excess of 100 ms to recover. That won't work for AMTOR.

>communication in a significant disaster, and none worth mentioning that any
>other communication system is close to its equal.
<snip>

Come on guys, this is the '90s, almost the '00s. Whenever a major
disaster occurs (hurricane, flood, earthquake, whatever) the whole
world knows about it in a matter of minutes and help is on the way.
If a few hams want to boost their ego by acting as "Disaster Command
Control Central" or something, that's ok by me, but the real relief is
done by the guys in planes and trucks who bring in food, water and
supplies. Ham radio may have been of some use years ago before
Satcom, but every year it becomes less relevant. The new Iridium
satellite communication system is about to become operational and when
it does, ham radio will have lost its usefulness in an emergency.

Don't get me wrong about ham radio - I've been licensed for 41 years
and still love it, but disaster communications are best left to the
professionals, not ill-trained amateurs. If you feel the pros don't
have the capabilities they need in an emergency, then work with your
officials to bring them up to snuff, don't try to replace them with
"volunteers" who may or may not be there when the you-know-what hits
the fan.

Hi,

Have you set up the correct command line? If you have re-installed
PCPakratt II it needs to know the port and the baud rate.

Create a batch file containing the line:-

PP.EXE -b4800 -COM1 (4800 should be changed to the baud rate you want)

Then run the batch file to start PCPakratt. This is covered in the
program's on-disk manual.

If the TNC won't respond to another program and you've tried the
autobaud routine (typing *), then it may be in host mode, try typing
^AOHON^W that's Control A OHON Control W (return), this is in the TNC
manual if you need more info.

Regards,

Roger Basford (G3VKM).

Is there a DOS-based software for programming the FT-51R or the IC-207?

Thanks!

I would find it quite difficult to talk on the internet with the four or five other people I talk to on a regular basis going to and from work. I would have found it VERY diffcult calling on the internet to be evacuated from my flooded home March 1 of last year when my phone did not work. I would also have found it quite difficult calling the police over the internet to a motor vehicle accident I was involved in.

Your arguments against ham radio can be offset by many other people's arguments for. It is a moot point - each has a viable place in our society. If you wish to spend your time on the internet, please do so. I enjoy each in it's own time!

Although I don't think there is a version already compiled, the linux
based software has the c code to send the right characters and would
only need some serial code written at most. Anyone upto it?

milton

To work a long path connect in linked mode, put an '!' in front of the
callsign when you link.. .i.e (in command mode)

AMTOR !ZL1XX
or
PACTOR !ZL1XX

works great on the Kam.

If you're using Windows, you can use hyperterm on the serial port. (Or under Windows 3.1, Windows Terminal). Once you bring up the Terminal program, make sure your at the *correct baud rate*, (try 9600 first) and turn the TNC off and back on. If you see garbage on the screen, you're at the wrong baud rate... try setting it to a different baud rate, if you see OHOY on the screen, type in the following:

<CTRL-A> O H O N <CTRL-W>

and that'll put you in terminal mode.

I use the official program from Timewave, it is easy to switch modes and make changes
to your tnc setting. Also Timewave has the pactor upgrade available and they package it with the software. Also check out " airmail " a program for sending email using the PK 232 mbx with pactor.

4381. Pactor newbie needs help please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-19 00:00:00 UTC
From: Paul Rodenhuis <paulr@patrick.com.au>
Message-ID: <362A95CC.CF4FED71@patrick.com.au>
Source record: 21969

Although I have been a Ham for more than 20 years, and been involved with
'Non-verbal" modes such as RTTY and Fax for almost as long, I have only recently started using the digital modes.

I bought a Kam-Plus (as per advice received from this NG). I have listened around a bit around 14.750 and copied various stations sending their email from boats back to loved ones. (This is the primary reason I bought the Kam, so I can do this in two years time).

Anyway a week ago I tried connecting to a ZL who was calling CQ. I couldn't connect in ARQ, but we managed to QSO in FEC mode. On Saturday we tried again. I had tried changing the TXDT (to 150ms) and TXDF (1 sec) parameters to see if it made any difference. It didn't.

He could connect to me, and my rig would ACK OK, but when I tried sending to him, nothing happened - well my rig kept keying but nothing was sent. We finally made it when he switched his TNC (AEA PK1287?? I think) to "Long Path mode".This slowed down the whole cycle, and we had ARQ connection both ways. I had also canged the TXDT parameter back to 50ms (default is 30ms).

BTW my rig is an old Icom IC-730, abt 17 yrs old now. I guess that the slow switching time from TX back to RX meant I wasn't hearing his ACK, so re-sent the first packet, over and over. Did his rig wait a bit longer in LP mode before sending the ACK, giving my rig a chance to hear it?

OK, I need a new rig, that's a given. But what parameters did he change that allowed my rig to work OK? What can I change?

Standing by for some informed comments and answers from the experts...
Thank You.

Thanks Rick, for the prompt response. Just what I needed! I guess that its somewhere in the manual ... it's about an inch thick and I haven't read it all yet.

Now, how about if I am using XPWare? I was previously using Hyperterminal so I could use the '!' command, but (again) I haven't read all of the XP documentation. Hey, I am a computer professional, I don't need no steenking manuals!

Cheers

There have been several good followups to your question. If you have tried
the suggestions and you still have problems, try our technical support at
Timewave. We have complete tech support (both online and phone), repair
service, upgrades and accessories for the PK-232/PK-232MBX as well as other
AEA multimode data controllers and TNC's. The latest upgrade to the PK-232 is
the PK-232/DSP that adds a DSP front end for greatly improved performance in
noise and QRM.

Contact Timewave via:
email: sales@timewave.com, service@timewave.com, techsupport@timewave.com
website: http://www.timewave.com
phone: 651-222-4858
FAX: 651-222-4861

XPware does understand the "!" prefix. Simply open the connect window using Alt-C
and enter an "!", immediately (no space) followed by the callsign.

Wow, that's a shame. Like you, I packed my gear away in the late 80s, although for different reasons (marriage+kids+school+job=no time). Just recently, when we moved, I thumbed through my old logbooks; comments like "great ragchew," notes about the person's family, interests, etc. abounded. I remembered friends like Ira WA1W (no kidding) and Jim (N1DDU) who were good friends made through ham radio.

In fact, about half of my log entries contain some personal notation about the other ham, indicating that I had acheived some reasonable level of communication with them.

Thankfully, having moved, I threw up a sloper, pulled the gear out of the attic, and am active again on HF.

It is interesting that I so much missed in ham radio what you claim to have never experienced.

Avery

Brand new Timewave DSP-59Y digital signal processor. Fits
in the Yeasu SP-5 and SP-6 speaker cabinet. Matches and
looks like orinigal equipment mfg. (OEM). See QST write up
a year ago. Rated the best design for a stand alone DSP.
Save $ Selling for $200 + $10 shipping. UPS in USA. 48 states.
Other places will have different shipping costs.
AES shows it selling for $389.

GREAT FILTER to improve all digital modes and will do RTTY
without a TNC. With Timewave Software and Win95/98

P38 for $295 recently, $325 often quoted by dealers.
Picked one up for $200 from a SALE bulletin on the packet network.
Have seen several other used P38 at $200.
Pretty cheap way to experiment with the HF digital modes.

Sounds like you work the paper chasers. Not many of the people I talk to
act that way.
You need to find real people to talk to and forget the paperchasers. MK

Of course it's not dying. I hear just as many or more people on the bands as I ever did. Ever try to find a clear spot on 75m for a 1 on 1 qso? Not too easy. No room hardly. Dead? not hardly. Same can be said for 20m and others. Listen to ten meters when it gets opened up. Dead? not hardly. VHF/UHF dead? not hardly... Whoever says ham radio is dying needs a new stethoscope. MK

Hi,

I am doing a mod and I read the intsructions for it thouroughly and it gave no mention of needing any more wires from the front connector than the ones I had already marked, so I cut the rest off of the head. Then today, when I finally got around to finishing the modification I discovered I needed wire 'H' off of the front connector. Could someone be kind enough to trace this wire back to its source and tell me which one it is? You help would be GREATLY appreciated.

Thanx,

~Chris,KC8GOQ~

Finally, somebody had the guts to say it straight out! March of Dimes = yes, hurricane brunhilda = no. simple as that. Ham radio is a HOBBY that would only be conceivably (did I spell that right?) indispensable if some horrendous nuclear war zapped commercial electronics, which, hopefully, will never happen.

I supposed FEMA and rural fire districts could be labeled "pretty boring
and useless," too. ;)

Ham do a lot in between disasters: build gear, refine what they've built,
have training sessions, have picnics together, work contests to refine
their communication skills, experiment with different antennas, ragchew
with one another (which builds fellowship amongst the local gang) -
a hundred other items could be included here.

With each contact we've polished our communication skills just a bit
more, tested the efficiency of our equipment, and had some fun!

Without daily contacts and weekend contests, I'd fail miserably
in handling emergency traffic at Oahu Civil Defense Agency during
our next hurricane.

>I have no idea why hams are generally considered boring people....

By whom? I have high regard for my fellow hams. People outside
ham radio probably think of us in the same manner they think
of say, coin collectors. It's not until a coin collector sits
the person down and explains the process of coin design, minting,
minute defects (which raises the value of a coin over its face
value), circulation, proof sets, et cetera, does that outsider
begin to appreciate that hobby. If folks outside ham radio
consider us boring, it's only because a ham (yourself?) hasn't
taken the time to thoroughly explain the ARS, its mission, and
its history.

Conversation is what you make it. If you didn't like the topic, you can change it can't you? People talk about radio's because thats usually the first thing that comes up. I've never had any trouble changing the subject. The part about talking to foreigners I don't understand. I don't talk to them any different than I do stateside. I've never viewed dx stations as cb'ers or children. Just another station as far as I'm concerned. I've spent hours ragchewing with dx. Ever try 160 m? Plenty of interesting conversation on that band. If you hear hams using banal conversation , maybe you should jump in and debanalise it. MK

Or go to www.microlet.com/yam to get the design for yourself. Although
the kit at infracom does appear to have a nice manufactured PCB, if you can
make a PCB yourself it would cost a lot less. The kit is about $110 Australian,
I built a YAM for around $40, including $20 for the Xilinx FPGA (5202).

The YAM-modem has an inferiour TX filter compared to the FIR filter used
in
the original G3RUH or DF9IC modems. The PICPAR modem
(http://www.baycom.de/tech/pictech.htm)
still uses proper filters (that can´t be changed like in the G3RUH-9k6
modem).

Sorry, but it is definetly not the *first* one... A PIC based modem
was presented by DF9IC on the 12th Int. Packet-Radio Meeting in
Darmstadt in 1996 and
later in ADACOM 9 (1996). The modem for the parallel printer port is
compatible
to the Baycom PAR96 standard and is called PICPAR. Kits are available
from
Baycom (http://www.baycom.de/tech/pictech.htm or
http://www.baycom.de/news/picsmd.htm for
the SMD version).
But as Infracom is the French distributor of Baycom, their
modem may be the same, although the layout looks different.

I know of at least 2 other 9k6 modem implementations on PIC processors
(one from Croatia, the
other from Germany).

Avery OM,

I could not agree more. Every day, twice a day, I am on the air for 30-45 minutes, morning and evening, on my way to/from work. 40M CW mostly. Almost every day I have a great QSO with someone, and we cover all kinds of ground from family, QTH's, antennas, rigs, weather, bio's, you name it.
This morning on 40CW I got a call from an old friend from 18 years back. We both flew the same kind of airplane (Mooney M18 Mite) years ago, so we had a lot to talk about. Just one example.
There are LOTS of FB ops out there, at least on CW. I can't provide any info re: phone, since I am not a phone man.

73 and Enjoy,
Don, W6JL

The PIC-RCT has nothing to do with a PICPAR or PAR96 : it requires a packet-radio controler to work, it's not a stand-alone modem. Take a PK232, add a PIC-RCT, and you have an easy 9k6 solution.

In addition, its retail price (about $35) is far below the price of PICPAR (about $74) or PAR96 (about $108).

At this moment, the cheapest stand-alone solution remains the YAM modem from Nico Palermo, with Dos, Windows, and Linux drivers (full-duplex is allowed in this last driver) : around $50 for a kit, if my exchange rate is correct.

Even solid state rigs are more radiation hardened than their operators.
If the operator survives, the radios should too. Note we're talking ionizing
radiation here, not NEMP. NEMP is a different topic. Radios hooked to
long unprotected conductors (HF antennas, power lines, etc), will be toast
due to NEMP. VHF/UHF battery powered rigs should be fine. It is possible
to NEMP protect HF equipment too. It is just an extension of what is required
to protect against lightning strikes. But as noted in another post, HF
propagation will be shot for months at least after a major nuclear exchange,
so the issue is somewhat moot.

That's really not fair.
Most hams are not lazy; they simply don't have the
technical knowledge to comprehend digital networking,
much less "improve" it. This doesn't make them "bad"
or "lazy." Technology is simply changing far too quickly
for the average hobbiest to keep pace and it's unreasonable
to expect them to do so. I barely have time to say "wow"
before some new wonder comes down the pike, making the
last one obsolete.

The FCC tried in 1974 to open the ham bands for true
exploration and experimentation by adopting
a bandwidth-based, rather then mode-based, frequency allocation.
Any emmission would have been "kosher" as long as it met
the standard. The ARRL, short-sighted as always, talked them
out of it. Darn pity. We might actually have been able
to do something "new" and useful by now. No... we can't compete
with the young turks in multi-million dollar labs and big funding.
A few of us, like perhaps you, can hope to make some progress
in our limited fields of expertese. Don't damn everyone
else for being different from you.

For that matter, there are large numbers of people without the equipment and/or skills to set up the deviation for FM speech, or to set up the drive level for a "Linear" amplifier on SSB. Both of these relate to more traditional modes, that have been more widespread than data modes. If THEY haven't got setup issues into their folklore, then what else has any sort of chance? I'd put it more strongly than Gary phrased it; discussion of these matters is very important, for otherwise many would not become aware that they were missing anything. It's always too easy to blame "Conditions" and never realise that things don't have to be so difficult.

> is at a remote site depending on alternative power sources.
>

Indeed. It looks to me like there's a market for a properly designed, dedicated data radio, either built or as a kit. The TX side of speech radios are not without their limitations, so further link margin improvement is possible. A 10dB advantage in signal to noise ratio equates to a very big change in BER even for relatively simple modulation formats. If such things got into a few people's hands, word would spread rather rapidly. Information about whether or not something is worth having seems to propagate an awful lot better than how to set things up ;-)

Cheers
David GM4ZNX

4431. Newbie digital mode questions!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-22 00:00:00 UTC
From: TL <tl@nospam.net>
Message-ID: <362F2321.AFDF8496@nospam.net>
Source record: 21873

Greetings,
Well, I have been using CW since I became a ham, and I
now would like to experience other digital modes. So, I have
several questions:

a) Which modes (i.e. RTTY, PACTOR, AMTOR, etc)
are the most popular? Which frequencies/bands can
they be found on?

b) I have heard that HF digital modes is seriously affected by QRM
and that I shouldn't even try it and should try digital mode only
on VHF. Is this a good piece of advice?

c) How usable are the HAMCOMM based kits that I have seen
such as the "VolksRTTY"? Do you know if they are still available?

d) If you could give any advice about digital modes of operation,
what would it be?

Thanks in advance,
Tony Lyon (KJ5XF)

Pactor and Rtty are the most popular. You'll find them on all bands but 20 M probably has the most activity right now.

>
>
> b) I have heard that HF digital modes is seriously affected by QRM
> and that I shouldn't even try it and should try digital mode only

Bad advice. Digital modes designed for HF (especially pactor) have no more QRM problems that most other modes. Pactor and Rtty signals are only about 500 Hz wide so a narrow filter in the receive IF is extremly helpful in minimizing QRM. Where many run into QRM problems is because they use a wide SSB filter in the receiver.

If you have a computer a HAL P38 card is a good option. It will give you Rtty, Pactor, Amtor (not used much any more) and Clover. Another option for Rtty is to use one of the software programs that works with the sound card.

Hi:

Some local hams are still using Commodore c-64's with an old version of Digicomm. Does anyone know if a new version of Digicomm has Pactor as part of the package now?

Thanks, and 73
A.C.

Except during contests, PACTOR is most popular today.
During contests, RTTY activity picks up to where it is
probably the most popular. AMTOR is rapidly falling
from favor. Other modes such as Clover II, PACTOR II,
and GTOR are growing, but are still less used than
plain old PACTOR. That's because the latter modes
are proprietary to their respective manufacturers while
PACTOR is generally implemented by everyone making
a serious digital box or program.

You can find digital activity on all of the bands, but 20m
is generally the busiest. Start tuning down from about
14.1 MHz to about 14.065 MHz. RTTY at the top, Clover
and other advanced modes near the bottom, and PACTOR
mixed in everywhere.

>b) I have heard that HF digital modes is seriously affected by QRM
> and that I shouldn't even try it and should try digital mode only
> on VHF. Is this a good piece of advice?

No. That's only true for HF *packet*. AX25 over Bell 103 is an abomination
for use under typical HF conditions. Don't even bother. The other digital modes
mentioned were *designed* for HF, and they work very well indeed.

>c) How usable are the HAMCOMM based kits that I have seen
> such as the "VolksRTTY"? Do you know if they are still available?

Pretty crummy. You'll get much better performance with a matched
filter design than you can possibly get with a system that counts zero
crossings. The best performance will be from the DSP hardware
units (P-38, PTC-II, etc), or from programs which use your sound card
for I/O and do software DSP on the host. An example of the latter is
Beezley's RiTTY. It is an excellent program if your computer has the
horsepower, and a genuine Creative Labs Soundblaster, to run it.

Plain hardware matched filter demodulators, like the old Hoff telco toroid design, can work pretty darn good too, but are less flexible because you have to accept the filter optimization you get, which may be fine for one digital mode, but wrong for another.

>d) If you could give any advice about digital modes of operation,
> what would it be?

As Nike says, "Just do it." You'll be amazed at what a good HF digital mode can do. But do it right, the zero crossing counters may give you a false impression of what a good digital setup is capable of doing. If you want to start cheap, then build a Hoff style filter demod for RTTY. It works well for RTTY and costs very little. The next step up would be something like a KAM with a switched capacitor filter demod. Next up in terms of performance would be Beezley's program. Beyond that, look at the hardware DSP units like the P-38 or PTC-II.

Nope! Digicom never got as far as PACTOR mode not even AMTOR either.
Last Version of DIGICOM was V5 for the 64 and 128's. It was
about the best term software ever written for Packet, but I
had to get me a Kantronics plus to proceed onwards to PACTOR.
You can use it with C64/C128 also if you get the aprotek
RS232 adaptor/converter plug to connect your CBM unit up
to your RS232 port. All it does is switch the voltage levels
from ttl (out of the CBM to 12 v going into the Kan plus.
CMD sells this plug for 19.95 if you go this route.
If you get a KAM plus be sure its got ROM version 7 or
later if you get a used one.

That's the truth. Anyone who knows me knows I am not lazy, especially where my hobbies are concerned. Ham radio, being one [just one] of my more passionate interests, gets its share of my attention. Problem is, I see new modes, new activities and new developments nearly every day. At first, I say to myself "Wow! That's cool! Bet I could do that too!" Then reality hits. 9k6 packet, for example, requires a better radio than I have, deviation monitor and other test equipment, time to learn the theory and time to develop a workable set-up. What do I give up in my life to try it out? Where does the money and time come from? Sorry, but until 9k6 is an appliance, it won't be seen in my basement. Other pursuits in ham radio - and other hobbies - have already claimed my time and money. Does this make me a "lazy ham"? Nope. It makes me appreciate the people who *have* put their enthusiasm to work for the betterment of the amateur radio community, however.

Sure, but not just with WinTerm. You have to have a TNC that does
RTTY (like a PK-232 for example). Then all you would do is open
up winterm and set the comm settings to talk to your TNC. Use
whatever command your TNC uses to go into RTTY mode and
sit back and watch.

When you have a full function TNC, all you need to make it work
is a dumb terminal program and a radio of course. Now, if you want
to do it with just your sound card, you need software that tells
your soundcard how to decode these signals - these are available
on the net, but you don't use winterm to use them.

Hi Ron. What you are actually copying with Windows "Terminal" is the output from a terminal unit. If it is something like a PK-232 which can interpret RTTY then you have no problem. I use "Terminal" almost exclusively in my shack.

Now, if you are using an old RTTY terminal unit, you have another problem. There is no interpreter to convert the 5 bit Murray code to 7 or 8 bit ASCII that "Terminal" understands. Before the advent of 'modern' digital communications, some of us were using 100 baud ASCII on the ham bands. That would probably works with "Terminal".

In the early 1980's I manufactured and sold a terminal unit for the Apple ll. It required dedicated software to interpret the Murray and Morse code.

You can do ASCII RTTY. Hyperterminal can be set for the right word length and baud to do ASCII RTTY with any dumb TU. But it only understands ASCII, not Baudot, so you can't do ordinary Baudot RTTY with it. You need software which maps the Baudot codes to a computer character set and vice versa. You can easily write this using any of the usual programming languages. A dumb terminal emulator is one of the easier programs to write, and adding a code translation filter is also easy. Of course if you're using an external multimode box like a KAM or PK232, then Hyperterminal works fine. The box does the code conversion for you and only expects the terminal program to understand ASCII..

I disagree. A nuclear weapon dumps enormous amounts of energy all over the spectrum. Your antenna resonates in several parts of the spectrum. More than likely, unless you are several hundred miles away from ground zero, your tubes will easily exceed maximum power dissipation in mere nanoseconds. In addition, what tubes are *actually* more resistant too, is static electricity, not nuclear blast. Radiatian will have a much worse effect on a tube than a radiation hardened semi device. Static electricity will take much more of a toll on a semiconductor devices, mainly devices like MOS transistors, etc, or devices with a fine geometry.

HAMFEST October 25, 1998 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST-COMPUTER SHOW - OCTOBER 25, 1998

LINDENHURST, LI - NY

On October 25, 1998 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic componets, computers and access-ories, softeware, books, technical manulas, ARRL information, Amateur Radio License Exams, Door Prizes.

[SOLD OUT]
Advanced registration is $15.00 each table. Tables at the door are $20.00 each. Contact Peter Portanova WB2OQQ at 516 541-4886 for table reserations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00. $5.00 with coupon. (Coupons will be available at the door.)

VE - ARRL - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID),
and the examination fee, to the exam seesion. 1998 ARRL/VEC fee is $ 6.35, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm following the Newsline Report on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

This begs an obvious question. Can anyone list any Amateur Radio transceiver or rx/tx combo, connected to an antenna, that is likely to survive a 100+ mile away nuclear attack? Tube and/or semiconductor. Or are we assuming a rig would really need to have been stored in a specially shielded container?

Is there a military or commercial surplus rig that is available to Hams for use on Ham bands that would meet the survivability specs?

BTW: Must we not assume that the operator is less resiliant than the rig? Is there not a several hundred mile minimum before the rig will have a living operator ... especially within a few days?

I'm still of the opinion that once a nuke war starts, unless a localized terrorist attack, that we will all be dead (or well on the way there) so quickly that we won't care about radios! Depending on what the fraud-in-chief gave away to get his wanna-be-jimmy-carter middle east accord we may be well on our way to a huge explosion in that region that could rapidly spread.

It is my understanding that ham rigs stored in a pickup tool box or car trunk,
for instance, are likely to survive the EMP. Somebody correct me if I'm wrong.

> BTW: Must we not assume that the operator is less resiliant than the rig?
> Is there not a several hundred mile minimum before the rig will have a
> living operator ... especially within a few days?

It is my understanding that human beings can survive EMP that wipes out
electronics. Somebody correct me if I'm wrong.

As a ham and a Police and Fire Dispatcher in Fort Myers, FL during Hurricane Georges, I think I can speak with some authority on the subject. We went to Hurricane status for that storm. Thank Providence that no damage occurred in our area. But for the record:

My department has installed antennas and mounts on the roof of police headquarters for the specific and sole use of my ham radio equipment. When the mounts were found to be loose the department had a special service done to get them anchored properly prior to the storm. I brought in my radios and they were placed on standby while I worked Hurricane status on 12 hour shifts dispatching police units.

The Lee County Emergency Operations Center was then staffed 24 hours a day by numerous hams in the area and they cordinated with other agencies in the area, especially the storm shelters that were operating, for real, from within the EOC.

We were very fortunate that the Hurricane did not hit this area. However, ham radio was and will remain an integral part of our Hurricane plans. The official position of my department was that a team could stop working on sandbagging the station long enough to get my mounts done. I'd say that gives the measure of their concern for ham radio being 100% available.

Cordially,
Bill Stewart
N4CRO

So you would not mind Red Cross spending $3000 each for Phones and
$2.00/minute for air time. to use a Satellite based system like
Iridium.

I would prefer that they get more for their money than a phone call.
Ham Radio Volunteers have for years have provided a proven reliable
communications system at very cheep cost.

In recent flooding in South Texas the San Antonio Red Cross building
was flooded, operations were directed from their Austin Texas offices
some 75 Miles away.
The communications network stretched over 200 miles from Austin to the
Gulf cost. All operated and staffed by Volunteer Ham's.

I would say the Ham Radio still provided the needed communications
system.
This is an area where the Cellular and PCS networks were still
operational.

IF I remember correctly, there is a removable header jumper that you can remove to disable the built-in lithium. Packratt had a nasty way of locking up for no aparent reason. Easiest way for me to recover was to cycle power and give it a "new birthday". I hate how when you bought the mailbox option you just got add-in pages for the glue-bound instruction booklet. Best thing to do is avoid AEA - which should be easy since they went down the tubes, and Timewave which seems to be cast in the same mold as AEA in the post-purchase customer support department.

If you have a sound card in your PC, I recommend downloading a program
called Blaster TeLetype. It's easy to find on the AltaVista search
engine, for example. An audio cable from your receiver to the line-in
jack on your sound card, and you're copying RTTY. Just a suggestion.

Now I suppose if one were really up on technology he would have a rig that
would key up on its own after the attact and send SOS so no living operator
would be needed. :-)

> Was/is CW an integral part of your Hurricane plans?

Cecil, Cecil!! No advance planning is ever needed to
substitute CW for SSB as long as operators on each end KNOW
and can USE CW!
All that is required is that all parties know that when
conditions get so poor that SSB no longer is readable, they
automatically switch to CW on the same frequency, and
continue on until conditions improve enough to resume SSB
contact. It is even possible that one station can copy the
other on SSB, while the weaker must send on CW to be heard.

What requires such intensive "Integral" planning??? Answer:
NOTHING! The only requirement is that operators be able to
actually send and receive CW. I know, that flies in the face
of the No Code Agenda, but it's still a fact of life.

More likely, our great CW operator, the one who was going to save his
numerous loved ones from the disaster, is the only one who expired in the
disaster and left everyone else untrained in the emergency use of his
SSB/FM transceivers.

Puuhleeze!. After 30+ years of hamming on HF through weak signal VHF work, I've found for all practical purposes, within maybe 3 db, SSB "gets through" as well as CW.
If propagation on a band goes out, you ain't gonna get through on CW *or* SSB. The common sense thing to do is to QSY or change bands. Not switch in 200 HZ filters, put the headphones on, and try to find a marginal CW signal buried in the noise. No one has bothered explaining why the simple expedient of a frequency change cannot be accomplished, or why a clear frequency can't be found in the case of a bona-fide emergency. And we're not living in an era where Joe Ham uses crystal control and AM for voice transmission, in case you've haven't checked lately.

As much as I support and use CW, I wish you FISTS guys would drop this ludicrous claim. You're embarrasing yourselves.

Puuhleeze! Only 3dB? Not significant or perhaps enough to
make the difference?

> If propagation on a band goes out, you ain't gonna get through on CW *or* SSB.
> The common sense thing to do is to QSY or change bands.

Absolutely, that's why most emergency situations demand
frequencies be set aside on both 40 and 75 meters-as is now
the case in Texas. BUT---let's just say that stormy
conditions are causing +20 dB static levels on 75, and
you're set up on 40 operating with emergency gear, low
power, static is no bargain here either, and conditions
fade.... You gonna just drop down to 75 when it gets rough
on 40? Think this doesn't happen? I'm afraid you've just
joined the 'No Problems' club.

Not switch in 200 HZ
> filters, put the headphones on, and try to find a marginal CW signal buried in
> the noise. No one has bothered explaining why the simple expedient of a
> frequency change cannot be accomplished, or why a clear frequency can't be
> found in the case of a bona-fide emergency.

Hey, you do whatever you can to make it work, of course.
But if you've never experienced situations where a mere
change of bands or frequencies won't do it, your 30 years
experience was somewhat limited. And what if one station
CAN'T change bands?

And we're not living in an era
> where Joe Ham uses crystal control and AM for voice transmission, in case
> you've haven't checked lately.

Well I *have* checked, and I'm not a backward "boatanchor"
maven-though I do have some of that type gear available. I
totally support using the best advanced modes and gear that
are available. That, I fear, is the problem. Not that many
HF hams have available these late modes, and contrary to all
the extensive claims from the theorists posting here, all is
NOT simple and so straighforward in the digital
communications world as it applies to ham radio.
My interest is to see that the code requirement is not
just dumped as "no longer of any communications value", as
so many no-coders insist. What's yours?

>
> As much as I support and use CW, I wish you FISTS guys would drop this
> ludicrous claim. You're embarrasing yourselves.

You don't suppose this reveals any shortcomings on your
part in the area of emergency communicatisons do you?? I'm
not embarassed that I have seen times when a CW capability
would have been very useful but was not available, nor by
the fact that I feel the need to point out that it is sure
to happen again.

Besides that, I only joined FISTS after I realized just
how much misinformation was being shoveled onto RRAP by
no-coders -exactly one year ago, in fact. My postion does
not represent that of the FISTS organization, and I will
refrain from posting my FISTS membership number so that you
will not be further confused by it.

Go play with your boatanchors.

Dick C

wrote:

<Tubes vs. semiconductors deleted>

: I disagree. A nuclear weapon dumps enormous amounts of energy all over the spectrum.
: Your antenna resonates in several parts of the spectrum. More than likely, unless you
: are several hundred miles away from ground zero, your tubes will easily exceed maximum
: power dissipation in mere nanoseconds.

What power dissipation are you referring to ? Are you referring to the
plate dissipation ? Even if the grid becomes highly positive, the
current emitted from the cathode is still limited and the power to
heat up the anode comes from the B+ line, not the nuclear blast. Or
are you referring to the situation that the control grid becomes so
positive that it will receive all emitted electrons and thus heat up.
Even in this case, the current emitted in a receiver tube is quite low
and EMP from the blast does not last very long (and there is also only
a 50 % duty cycle due to the resonated antenna), so I very much doubt
that the tube is the weak component. I would rather expect that the
insulation might break down in any resonating circuits.

: In addition, what tubes are *actually* more
: resistant too, is static electricity, not nuclear blast. Radiatian will have a much
: worse effect on a tube than a radiation hardened semi device.

While I can understand that a massive flow of beta radiation
(electrons) could cause problems to the tube _during_ the blast, but I
do not understand how alpha radiation (Helium nucleus that are stopped
by the class envelope of the tube) or gamma radiation would do any
permanent damage to the tube. I do not know the current state of the
rad hardened semiconductors, but usually they are required to operate
during a blast, but as far as I understand, we have been talking in
this thread about which equipment survive through the blast and are
operable after the blast.

I've seen times when a helicopter capability would have
been bery useful but was not available. It's all a matter
of Return On Investment, Dick.

I've seen times when a crash helmet would have been very
useful in an automobile wreck. Why aren't you advocating
crash helmets for automobiles? That would save a heck of
a lot more lives in a year than CW ever has or will.

I'm talking about atomic weapons deliberately exploded high in the
atmosphere for the purpose of knocking out most of the electronics
with EMP but sparing the population.

There is a window between CW not working and SSB working that is probably
about 20dB wide, maybe 3-4 'S' units. About the only time one sees that
window is when SSB fades and CW is still copyable. Realistically, picking
a random time and frequency, both modes usually either get through or both
modes do not get through. But if one really searches for it, one can usually
find a frequency/condition combination where CW gets through at a power level
where SSB fails. I agree with you that it is not dependable/predictable.
I agree with Dick et.al. that it can happen.

>experience was somewhat limited.

Only as a former member of RACES and a current member of MARS.
When area traffic handling during Desert Storm became almost extremely
difficult due to QRN on 4 Mhz and skip was out on the higher freqs, we
switched to VHF voice or packet and passed traffic to stations out state that
had better propagation.
We didn't switch the net over to CW. How ignorant of us.

> And what if one station
>CAN'T change bands?
Grasping at straws again? Like, how many one-band stations are there?

> My interest is to see that the code requirement is not
>just dumped as "no longer of any communications value", as
>so many no-coders insist. What's yours?
CW has *great* communcations value. About half of my hamming is on the mode.
Only it's not a cure-all for athelete's foot, baldness or bad breath as has
been claimed.

>As much as I support and use CW, I wish you FISTS guys would drop this
>> ludicrous claim. You're embarrasing yourselves.
>
> You don't suppose this reveals any shortcomings on your
>part in the area of emergency communicatisons do you??
Another incorrect assumption on your part.
See above. Even formal training and written exams on operating procedure from
Atilla the SMD.

What my statements should reveal is a difference of opinion with a number of
your assumptions, suppositions, statements and conclusions.

>Go play with your boatanchors.
Apparently, you're unhappy with my difference of opinion. Grow up. Live with
it.

BTW, I *do* plan to pick up my soldering gun right after posting this. Got a
new vintage CBS mic processor [Yowza!]

Actually, the above is incorrect. High level nuclear explosions put electronics at risk for EMP (electroMotive Pulse) damage, not radiation damage. There is little in the construction of conventional vacuum tubes that are at risk for this type of damage. This assumes the event takes place at some distance. If close enough to damage the tubes, the operators are also at risk. Also, though not an issue, fairly high radiation levels have little impact on vacuum tube technology.

Perhaps, but the idea is to maintain SOME type of
communications capability for as long as possible under the
most extreme conditions and circumstances. It is well known
that many emergencies accompany poor propagation conditions
such as cause this very situation. CW *WILL* work in low
signal levels and noise conditions where SSB won't-provided
operators are trained and experienced.

> >> If propagation on a band goes out, you ain't gonna get through on CW *or* SSB.

Nothing like a little ranting to cover your insecurities
Bill?
You've never tried to go from 40 to 75 meters and
encountered the S9+20db static level? Maybe you don't have
that in Colorado.
If you had done serious thinking on the subject, and
perhaps worked with emergency comms in really severe
circumstances, your outlook might be a little more
broadened. Better stay with your structured MARS and RACES
nets, less problems that way. Hope no one ever tries to call

in on CW with a real live emergency. I know that that it's
not likely. Most disasters are not "likely" to happen.

> > Hey, you do whatever you can to make it work, of course.

>

And you WERE NOT handling emergency communications, it is
quite necessary to point out. It's one thing to meet a
scheduled net, handle whatever they have to dispose of,
under whatever conditions and cicumstances exist, and quite
another to find oneself doing REAL TIME emergency
communications with lives at stake. Seems you have the two
situations confused.

> > And what if one station
> >CAN'T change bands?

> Grasping at straws again? Like, how many one-band stations are there?

How can you know who/what/where you'll be trying to
communicate with when you have no idea what the situation
will be??? You are clearly of the opinion that "if our
organized net type communications system won't handle it, it
just doesn't need to be handled." If a station called into
your net with emergecy traffic using low power on CW, would
he be ignored? Some of the structured situations get that
deeply into their rut.

>
> > My interest is to see that the code requirement is not

Oh. Another Cecil Moore, Mister "I love CW and it's a
great communications mode, but actually worthless." Where
the hell you guys get this nonsense? Did the real
communications capability of CW automatically die when more
advanced modes appeared???

> Only it's not a cure-all for athelete's foot, baldness or bad breath as has
> been claimed.

Add your name to the list of readers here who have a real,
serious problem with reading comprehension. To say nothing
of your thought process. If CW is a great communications
mode, why not keep it available for use as a backup to other
better, faster modes? You say we won't ever need it? After
the 'justification' that you've shown above?

>
> >As much as I support and use CW, I wish you FISTS guys would drop this

> What my statements should reveal is a difference of opinion with a number of
> your assumptions, suppositions, statements and conclusions.

Looks more like you disagree with your own opinions,
statements and conclusions. You say that CW is a "great
communications mode" but you evidently wouldn't use it at
all for communicating, nor plan to keep it available for use
when it may be the only mode available-if not to you, for
someone else with a serious emergency to resolve. You say
there's "only 3db" improvement in readability of CW over
SSB, but that's not enough to make any difference in austere
conditions. And you seem to think that you've seen it all
when it comes to emergency communications, despite no stated
experience in handling actual emergency communications. It
doesn't compute.

>
> >Go play with your boatanchors.

> Apparently, you're unhappy with my difference of opinion. Grow up. Live with
> it.

I'm puzzled by your self-conflicting posturing. Just what
is it you're trying to say? CW is great but actually it's
worthless?
Or it's just not "Cool" to support retention of a CW test?
If you're acting alike a 'Grownup', I'll just remain a kid,
thanks!

The hell with it, I'll use my FISTS number, I'm not ashamed
of it or of CW.

Dick W0EX FISTS #3939

When this happened to me it was because the TNC had got it's static ram
parameters munged. Take it to bits and take out the reset link. You
then start from a known set of factory defalts which should allow you to
talk.

If you want reliable communications down into the noise where humans
can't decipher it, then get a Clover card. The measurement is bits per
second decoded. The CW words per minute decoded is a fraction of
the Clover capability. If I was at sea in a life raft, I'd rather have a beacon
on Guard then a CW key in my survival kit. The most important thing is
location ("It's the location stupid"), location, location... Rescue groups
don't really care about anything else. Once they arrive on scene, they
will have more communications available than required. Then they can
take on the reports of dead, missing, or medical requirements.

The best things Hams can do, is set aside a disaster frequency in each
band, and design a Clover beacon to transmit a Flash stored beacon
when it detects salt water, or is engaged manually. Hey, if the ARRL can
allocate itself broadcast frequencies, they should be able to allocate a
beacon frequency in each band as well.

Where the internet can come in handy, is in a worldwide network of
stations listening for beacons, and networked together. Each node can
provide to each other node, the beacon heard, the frequency, the signal
strength, etc. Then a Web page can be mirrored at each site and
anyone can view it. For example a map of the world, with dB circles
around each site, and a symbol that shows whether the site has detected
a beacon, or not. If a beacon has Lat/Long then that can be shown.

During non-emergency the system would have great value as a
propagation tool. As each node goes through its self-test phase, it
transmits a callsign, lat/long, power level, and current minutes and seconds.
It would cycle through each band at three power levels (1, 5, and 20 Watts).

I think each node could be built for the price of a good HF rig, and be more
valuable to the countries that license us as a "service."

Hams still have assets that most governments do not. Number of
emergency listening stations is one of them.

Whoa. So the rescuers know the location. Until they know
the details of what happened at that location, they are
still in the dark as to what the need is and how to best
handle the response to that need. Some means of on-site
communications is still vital for survivers to pass out to
rescuers this vital information. Errors or ommissions in
this area are ssometimes responsible for huge mistakes in
relief efforts, negating much that could have otherwise been
accomplished in a much more timely manner. In
disasters/emergencies, time is always of the essence.
Nothing is more vital to a relief effort than timely,
accurate detailed information as to the scope of what
happened, where and to whom the relief effort should be
first directed, and why. This information is difficult
enough to gather in such an event at best, and the lack of
communications to pass it to the proper officials is a huge
obstacle. Hams are well positioned to fill this need, with
VHF/UHF gear, repeaters and nets. HF must often be used to
then "get the word out".

Once they arrive on scene, they

> "No FEC means: no throughput"

Good information, great idea.....coupled with GPS position
info, these beacons could serve any emergency location need.
Lots of details to iron out but those almost always prove to
be no insurmountable problem. Of course one could include
simple communications capabilities within the transmitted
signal so that those in distress could provide needed
details. What could be simpler than to add some sort of
Morse keying to the unit? With BPSK, FEC and the whole
works. No one says that OOK Morse is the livin' end, that's
just what we are continually accused of saying.
Of course it requires operators who have learned a minimal
level of skill at operating in Morse mode. Digitized voice
might be included in such a system instead. 'Whatever works,
when it works' is my motto. Of course, today CW is what
works. Tomorrow may be a different story.

NO FEC= NO throughput? Well, not quite....just much less at
a lower rate.
Oh....that probably DOES apply if no one present knows the
code.

>shielded container?

Virtually any amateur rig should survive a ground burst or low air burst
100 miles away. That's well outside the range of the prompt effects of
a nuclear weapon. Of course if the burst is 100 miles up, then that's a
somewhat different story. Then there will be a NEMP effect that extends
beyond the blast and flash burn radius of the device. There's very little
NEMP for a low burst because the atmosphere is sufficiently dense to
rapidly absorb the X-rays from the detonation and convert them to heat.
So you don't get NEMP effects beyond the flash burn radius. Since the
latter is more serious, the former can be considered moot.

At 100 miles up, however, the atmosphere is sufficiently thin that the
X-rays can travel large distances, and accelerate Compton electrons
to generate a large electromagnetic pulse. This effect will spread over
an area of several thousand square miles. Fortunately, the inverse
square law comes into play. The field intensity from the NEMP of a
20 MT device detonated 100 miles up to a point on the surface will be
roughly equal to the field intensity 8 miles from a lightning strike (in
every direction). That's not of much concern to electronic equipment
directly. We don't need to seal our equipment in a Faraday cage to
protect it from direct effects of NEMP.

However, long exposed conductors will suffer an induction equivalent
to having a lightning EMP 8 miles from *every point* along the conductor.
So extended conductors such as the power or telephone grid are very
vulnerable to NEMP, as is anything connected to them at the time. The
cumulative surge on these conductors can reach huge values. There
is some concern with unprotected long HF antennas too. So you should
have NEMP rated surge suppressors on power and antenna leads to
avoid *indirect* damage to your equipment.

If you've engineered your station to tolerate direct lightning strikes,
and you can, then you needn't worry about NEMP. NEMP won't present
you with voltages or currents in excess of what you'd see in a direct
strike. The pulse risetime is a bit quicker, however, so you need fast
gas discharge devices. Those which are fast enough will have a NEMP
rating. (Polyphaser has them.)

>Is there a military or commercial surplus rig that is available to Hams for
>use on Ham bands that would meet the survivability specs?

As noted, even Radio Shack radios should survive if ordinary precautions
are taken to protect them from surge.

>BTW: Must we not assume that the operator is less resiliant than the rig?
>Is there not a several hundred mile minimum before the rig will have a
>living operator ... especially within a few days?

That depends on where you are with respect to a target zone, which way
the wind is blowing, and whether you have taken any fallout protective
steps. The following estimates are from The Effects of Nuclear Weapons
and assume a 20 MT device. Most devices aren't that large today.

In general, unless you're in a hardened shelter (like Cheyenne
Mtn), inside 3 miles you're toast due to blast and heat pulse effects.
Inside 10 miles you still need to be sheltered from the direct blast, but
an ordinary concrete and steel building will suffice, and you'll need
independent oxygen to survive the following fire storm (about an hour's
worth). But at 30 miles you're outside the horizon of direct blast and
heat pulse effects, and you have between 15 minutes and 3 hours to
find shelter from the fallout (depending on which way the wind is blowing).
At 100 miles, you aren't likely to be directly aware that anything is
happening, and will have from a couple of hours to a day or two to
seek shelter from the fallout.

Immediate life threatening levels of fallout will decay within 2 weeks of
the blast. If you can shelter that long, you'll have a good chance of surviving
the war. You'll have to start decontaminating the areas where you work and
live immediately, of course, or long term radiation exposure effects may still
get you. Realize that a majority of the inhabitants of Hiroshima and Nagasaki
did survive the war, and that there are flourishing cities there again. The
weapons today are bigger, but our country is much bigger too.

>I'm still of the opinion that once a nuke war starts, unless a localized

>fraud-in-chief gave away to get his wanna-be-jimmy-carter middle east
>accord we may be well on our way to a huge explosion in that region that
>could rapidly spread.

I don't think that's the case. According to the best estimates I've seen,
we'd lose between 20 and 100 million Americans in a full scale nuclear
war. (The variance is largely due to how stupidly or not the people will
react when the war happens.) That's less than half the population worst
case. If the survivors take sensible fallout precautions, the loss could
be as low as that suffered by the former Soviet Union in WWII. That's
survivable as a nation and culture. The world would be a less healthy
place for some hundreds of years, but it wouldn't be armageddon.

The estimate assumed the US and Soviet Union at peak nuclear
strength. With current levels of disarmament, nuclear war has
become much more thinkable than just a few years ago. Instead

of having to absorb 20,000 nuclear explosions, today either side would only have to deal with less than a thousand. And today's bombs are smaller too (average 150 KT). That's a somewhat scary trend. It is making nuclear war fighting look like a winnable proposition to a leadership willing to take large losses.

There is no conflict.
Read my figurative lips. Richard. I'll write it out o-n-e more, and one final time:

In my opinion and experience, any technical advantages CW might have over other modes under adverse conditions are extremely limited and most hams will never find themselves in the situation where your so-called solution is the only communications option. To use the possibility of communicating on CW while other modes absolutely won't work as a linchpin argument for the retention of CW is not compelling. Not to me, and not to many others. Since you would like to keep CW as an integral part of the amateur examination, you would be wise to understand the argument isn't selling very well. Just as any other promoter of a political opinion should.

I wouldn't buy a magazine subscription from you, thanks to your personable style and diplomacy.

>Or it's just not "Cool" to support retention of a CW test?
An incorrect assumption. Since you've obviously read my past posts on r.r.a.b and elsewhere, you would have noticed that I personally support the existence of the CW requirements as the price of admission, but for different reasons other than this one you're so adamant about....And I've stated any easing of the CW requirements...if inevitable... *must* be balanced by a corresponding alteration in the written or technical tests.

I've written nowhere in this thread that CW should not be retained, have I? Do not under any circumstances publicly attribute points of view to myself that were not made. It's not going to be my problem that you cannot comprehend and respect the opinions of others in this forum.

>If you're acting alike a 'Grownup', I'll just remain a kid,

As always, your information is quite thorough and well presented, thanks!

It is a concern to me that I have rarely, if ever, seen a good assessment of collateral damage.

The targets of a big exchange would be major cities and industrial sites. The resultant loss of sewer treatment plants, water treatment facilities, biological and chemical containment and neutralizing systems, law enforcement, firefighting and governmental infrastructure would seem to indicate much greater loss of life and social anarchy (or the declaration of a national and state-level state(s)-of-emergency unlikely to result in a return to democracy). The seeds of anarchy and dictatorship are already well established here, though carefully camouflaged.

A likely scenario may be a network of chemical and/or biological attacks to which we respond aggressively, that sets off a series of ever-widening responses and counter-responses which then triggers a nuclear barrage from multiple sources. The complex nature of initial blast death and damage, fallout, firestorms, polluted air, water and soil, lost infrastructure (described above) may geometrically magnify losses. We may also consider that the bombs that we drop elsewhere in the world will deposit garbage in the atmosphere that, together with what we receive, likely drift over us and alter for decades the world's weather system ... eco-Chicken-Little Al Gore would be in his glory!

BTW: You do make a good argument to relocate to Wyoming or Montana! :-)

This was a big concern a few years ago before the Soviet Union collapsed.
There was even a TV mini-series, "Amerika", based on the premise. The
Soviets exploded their nukes far up in the atmosphere and took over the
country before we realized what was happening because almost all
electronics and communications had been destroyed.

I am a newbie to packet radio and just purchased a new Kantronics KPC3plus TNC. After following instructions on connecting the serial cable to the PC, I ran the Pacterm program, selected com 1 (F7) from the setup program and then hit backspace.

As described in the manual, the TNC began to run its Autobaud routine and the "Press (*)..." and some garbled text began to repeatedly appear on the screen. Per the instructions I hit the * key and nothing happens. The "Press (*) ..." message continues to scroll on the screen.

Am I doing something wrong? The serial cable works with a regular modem. Any help will be appreciated.

Thanks,
John KB2YJH

That's not really true.

1. Get them to surrender.
2. Make them impotent.
3. Non-Lethal Means
4. Lethal Means.

The military, and its soldiers have one goal: win the battle. In the old days of
frontal attack, this leads to victory. Non-Frontal warfare is another story. Winning
all the battles doesn't mean you win the war (look at Vietnam and Iraq wars).

General Patton bypassed a whole German Army in the southwest of France. They just assigned troops to effectively neuter them. They were still fighting skirmishes
when the US Army was completely inside Germany.

Item 3 is an area where intensive research is being conducted. Even police use some of the simpler methods, such as stun guns (hand held, or fired at range). It's actually better to not kill the enemy, as it requires a whole Division to clean up
the battlefield. From bulldozing the bodies, to caring for the wounded. It would
be nice if everyone would just die, but some of the bastards live on for months and years that require huge resources.

Same with fighters. The USAF is looking at various means of disabling aircraft. Rather than blast it out of the sky, getting it's engine to quit, or it's canopy sandblasted is just as effective. This probably won't be very effective, as the capability of BVR kill (beyond visual range) has increased dramatically, and was used in the Iraq war. The electronic fingerprint of an SU or MIG is very pronounced and you can see them from engine start to kill as a little track on your scope. There's no sense getting in close, if you didn't make them impotent while still on the ground.

The trouble with high altitude nukes, is that all those test in Nevada, showed that we can't make EMP proof systems very well. If we burst a nuke high in a battle, the chances are good we will break a lot of our own stuff.

Using the sunk ship scenario: say you collided with a whale and found yourself
in the water with dead bodies, broken bodies and yourself floating in the
debris?

Do you want to hold a conversation? or, do you want the nearest ship or
helicopter to come and get you out of the water.

I've been in the water at survival school. I have to tell you, it gets real
cold
real fast! Even though 80 degree water feels good when you first hit it,
the fact that it is 16 degrees below your body temperature means bad
things are going to happen.

Does the information one has about dead bodies or wounded survivors
help anyone? No. An emergency rescue assumes that people are
injured or will be shortly. Otherwise it's not an emergency.

All they want is location, so they can turn a ship, or vector an airplane.

One of the reasons the USAF gave us "poopie-suits" (rubber coveralls)
was so that our body would float after death, and Mom and Dad would
get the body back instead of a "lost at Sea" letter. So the best thing to
do early on is to make the bodies float. That way thousands of bucks
don't have to be wasted tracking the shark school up the coast...

4504. Packet Activity In Tampa Bay Area

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-25 00:00:00 UTC
From: "Peter L. Stephens" <pls95@gte.net>
Message-ID: <710prkmis1@news-2.news.gte.net>
Source record: 21896

I have just moved to the Tampa Bay area. If anyone out there knows where all the packet activity is in this area, please send let me know (Freqs, baud rates, etc.).

Also, if anyone knows a good web site that lists packet activity for different areas, that would be great as well.

Thanks,

Pete, KD4ETS

IMO, a much bigger threat than nuclear weapons is biological terrorism. We already know that containers of anthrax and bubonic plague have been smuggled into this country. They are likely to be released for the millennium. The US government has a list of 120 cities likely to be hit. That's one reason I retired early. To survive such an attack, one needs to live far from a target area and have a pressurized room among other items.

I thought the purpose of the high altitude burst was to maximize spread of radiation and kill as many people as possible.

As one of the guys at "ground zero" in the recent Texas floods I'd like to give you something to chew on. The use of CW was never even considered because it (a) wasn't necessary (SSB worked fine) and (b) nobody had TIME to play with keys. When real emergency communication is needed, it's needed NOW. When the NWS is asking for local readings of river height (because their satellite links take several HOURS to update) you don't have time to PLAY radio, you have to USE the radio. If the band doesn't work, you try another one. If that doesn't work, you start hollering on the VHF and UHF linked systems to see who you can raise who CAN get through. You don't use the internet because the phones quit working 3 hours before the emergency because half the circuits are trying to give dial tones to lines submerged in the river and the other half are tied up by everyone in town calline everyone else in town to ask "did you hear about the FLOOD?". (Why do you think there's a communications emergency! If officials COULD use the phone they WOULD use the phone! The local servers were working just fine, IF you could connect to them and hold the connection.)

What we DID have due to the code requirement was a SEVERE shortage of HF operators in the flooded area. I was one of the three operators in Victoria Texas who could help with communications and who had a high enough license class to use an HF rig.

I was literally turning Tech operators away who wanted to help because I had no place to use them while we did a (very poor) job of keeping the HF side of things going. The net result was that most of the useful information going into/out of the area during the height of the emergency did so on tenuous 2 meter and linked systems while the HF band sat virtually idle because of the current rules structure. We were feeding "ground truth" to NWS Corpus via the local 2 meter machine (when the guy in Corpus could hit it with his beam) and via a recently expanded linked VHF/UHF system when he couldn't get in direct. Sometimes he couldn't work either and we relayed to him via outside operators on HF. On the occasions when I was on HF I could relay to him. One of our other HF operators was upstream in Cuero in his own (much worse!) hell night and the only other HF op was at the EOC with a handheld because he was the contact man. We didn't HAVE time to set up an HF rig at the local EOC until two days into the fracus (and then only because someone remembered there was a 10 year old antenna on the roof), so ALL communications originated and terminated on 2 meters until then. Even after the HF station was set up, its use had to be limited because of interference with the 911 system.

With even HALF of my available tech resources licensed on HF we could have covered this thing like a blanket from start to finish.

N5NAV and the rest of the Texas Emergency Net did one HELL of good job of keeping the net going and keeping in touch with Department of Public Safety headquarters in Austin, but 90% of the time they didn't have anyone to talk to in Victoria because of the code requirement to get onto the HF bands.

Before this I was undecided on the "code vs. no-code" issue. This polarized me totally toward getting RID of this anachronism!

No, you want a ground burst for that, so it pulls all the dirt into the
air and drops it all around. Much more lethal.

In reading your story, I see one big glaring hole:

Zero Disaster Preparedness

What the hell are you guys doing down there? You can't all run to
Red Cross or Salvation Army when the disaster hits, you need to practice
and build infrastructure.

I don't see it as a no-code problem, I see it as a nobody gives a shit
problem. Maybe now you guys will sit down and think about communications
requirements and who's going to do what, BEFORE the next disaster.

Harvey, hate to say I told them so, but I told them this was happening.
The code requirement is limiting the number of HF operators available
for emergencies. If we are not careful, the code requirement will wind
up costing lives instead of saving lives.

"This anachronism" is of course the Morse code test, not CW, the mode.

The RACES rules specify that an operator of a RACES station need only be "a licensed amateur" so a Novice, No-Code, Tech Plus or better would qualify. At one time even a non-licensed person could be certified as a RACES operator.

The caveat is that the RACES network has to be activated (an official Disaster Services proclamation, IOW) and the RACES station can communicate only with other RACES stations, amateur stations which are recognized as part of a "civil defense" [sic] operation, U S government stations, and any other station specially authorized by the FCC to so intercommunicate. In addition, a separate rule dealing with a "declared communications emergency" gives the FCC wide latitude to specify the conditions of such communications, which conceivably could include relaxation of license class rerstrictions. I don't have access to "the book" anymore so I don't know what the current procedures and standards for such declared emergencies are.

[Rule sections available on demand].

BTW - in the discussion on "widespread, maybe multi-state" disasters, howcum no one mentioned that there will be a whole lot of operators and stations using HF in the course of disaster control/relief without benefit of any class of amateur license or code qualification.

We call them the National Guard.

There used to be some on 20 meters, but it was never set up right.

Since AX.25 on HF requires small packets, you have to coordinate a
group to operate in the "segmentation" mode, as the IP and TCP
are 40 bytes already. With segmentation only the first packet
has the IP stuff, all the rest are the data. You also need to shut off
ppersist (don't wait, send! Else it will be VERY polite and never
transmit).

Alas, AX.25 on HF is pretty much a lost cause for even keyboard QSO,
let alone as a data pipe.

Is there a strategy in China, the former Soviet Union, or other nuclear powers that suggests this as their plan?

I could see a mix of explosion levels, but seriously doubt a plan that is worried about population harm ... warriors tend not to be humanitarians ... one fellow said "Our job is to break things and kill people!" Lots of population losses has always been key to early surrender, witness WWII versus Germany and Japan. The inability to impose massive population damage was the reason Germany was racing for the nuke, the bombing of England mostly harmed infrastructure ... and failed.

>well established here, though carefully camouflaged.

There are several points here. Note first that the Sagan nuclear winter scenario has been thoroughly debunked thanks to the data gathered from the Kuwait oil fires. The junk rains out much faster than Sagan's model predicted. Also realize that most of the infrastructure lost is infrastructure which services the prime target sites, and they're toast. They don't need it anymore. Also realize that 64% of the violent crime in America occurs in 5% of the land area of America, and most of that 5% is ground zero.

I'd also opine that a much reduced government infrastructure is likely to be a good thing. We are choking in regulation today. As I note on any Federal holiday, Atlanta would be a much more liveable city if we could somehow rid it of the federal bureaucrats. There's certainly no traffic problem when they all stay home. OTOH total anarchy isn't workable either. I doubt we can strike a comfortable balance under the stress of war.

In the immediate aftermath of nuclear war, local power will be absolute. There simply won't be the transport, or the resources, to move in enforcement from other areas. How each local area reacts to that would be interesting to consider. Near surviving military bases, I think it would be safe to assume that martial law would be enforced. But in other areas, things might be very different. Bringing the country back together under a single leadership might be a very difficult and long process. It might prove impractical. The US could become several separate nation states. With its major cities gone, the demographic balance would certainly shift radically.

>A likely scenario may be a network of chemical and/or biological attacks to
>which we respond aggressively, that sets off a series of ever-widening
>responses and counter-responses which then triggers a nuclear barrage from
>multiple sources. The complex nature of initial blast death and damage,

>fallout, firestorms, polluted air, water and soil, lost infrastructure
>(described above) may geometrically magnify losses. We may also consider
>that the bombs that we drop elsewhere in the world will deposit garbage in
>the atmosphere that, together with what we receive, likely drift over us
>and alter for decades the world's weather system ... eco-Chicken-Little Al
>Gore would be in his glory!

Most of the fallout (nuclear and non-nuclear) would rain out very quickly, we know that now. It would be deposited in the top inch or so of the soil where it would have to be scraped away before the land would be usable again. And it would be deposited in lakes and streams where it would become trapped in sediments. Fish might not be safe to eat for decades, but most water would be safe enough to drink after a few weeks. I think we can rule out major climate change as a result of nuclear war. While the weapons seem big to us, on a global scale their impact is actually quite small. For example, the energy released by an average hurricane in one hour is equal to all the nuclear weapons in all of the world's arsenals combined.

A possible odd side effect of all this is that some diseases might decline. As you probably know, radiation is used to sterilize food for long term storage. It is possible that the high radiation levels in the first weeks would do a similar thing to environmental disease organisms. OTOH most disease organisms can't live outside a host, so the crowding in shelters and displaced person camps might make disease run rampant. Since most major hospitals are located in target areas, as are most large drug companies, they wouldn't be available anymore, and treatment of disease and injuries could be a daunting process. Some form of triage would likely have to be practiced, with those too sick or too badly injured simply allowed to die.

>BTW: You do make a good argument to relocate to Wyoming or Montana! :-)

I wouldn't go there. There are missile fields there which would be prime targets. (Assuming they haven't all been deactivated by the time the balloon goes up.) Oddly enough, the area near Dalton Georgia is one of the safer areas in case of attack. All of the fallout pattern maps show that it receives very little fallout in any credible attack scenario. To put it bluntly, there's nothing worth targeting which is up wind of it for a long ways, and the Appalachian foothills create a wind pattern that keeps most fallout from target areas away from it. There are a number of other pockets around the country like that, not all of them are in remote areas.

You also have to realize that wherever you light, you're going to be stuck there for a long time. You want a place where the climate, soil, availability of water, and other factors make is possible to survive there comfortably. Remote areas are generally remote for a reason, people have a hard time living there. Ideally, you want to find a small town which used to be well populated before the post-WWII exodus to the cities. It will likely be quite livable, and will likely have enough infrastructure to keep you above bare subsistence. And if you guess wrong and doomsday doesn't come, you still have a nice place to live.

I'm not a doomster, and I doubt I'll see a nuclear war in my lifetime. But I did choose to live more than 30 miles from the nearest target, and behind a ridge from it too. I also have a place that is in the rural heartland where long term living would be comfortable, and the fallout maps say would be relatively clear. In reality I intend to retire there, but if world tensions became high, I might be tempted to retire early.

The line between prepared and paranoid can be a fine one. I don't think I've crossed it. But even if I have, being paranoid doesn't guarantee that they aren't really out to get you.

HF is rarely used in comparison to VHF.
The overall reliability of and actual use of
VHF has been well chronicled in the pages of QST and

CQ magazine.

Gee, that sounds easy! maybe it even will be. Depends
entirely on exactly what sort of disaster/emergency we're
talking about doesn't it?
An aircraft down, the ELT sounds off, is DF'd and the
location pinpointed, situation assessed by a flyover,
situation handled, no problem.

But lets look at the sort of disaster I'm trained for and
much more familar with. What if it's a massive earthquake,
stretching over a wide region covering parts of several
states involving several major cities? Literally millions of
people can easily be involved, schools, hospitals, nursing
homes, other population concentrations are at risk for large
numbers of casualties. What does the beacon do for them? How
do those persons/entities gearing up for a massive relief
movement into the area plan their approach without
definitive information as to what the need is, where it is,
and at what level? Just because a recon aircraft pilot sees
what appears to be a damaged hospital may not mean that the
need for large relief effort is necessarily required.
Without communications to define the need and concentrate
the relief effort to those spots where it is really needed
the worst, poor efficiency and waste of critical
effort/resources is sure to occur.

> >Some means of on-site
> >communications is still vital for survivers to pass out to
> >rescuers this vital information. Errors or ommissions in
> >this area are sometimes responsible for huge mistakes in
> >relief efforts, negating much that could have otherwise been
> >accomplished in a much more timely manner.

> Such as?

Such as sending large quantities of unneeded supplies/personnel to spots where very few are actually needed, while missing areas where those very resources are critically needed. A tragic waste of limited relief resources. Such as sending a field hospital with staff to an area where with few casualties while an unknown spot with many injured is bypassed. Effective communications helps to preclude these errors.

Indeed, and that is the very reason for your complacency on this area of communications. Just because we have not needed to handle a quite large disaster in the electronic communications era, we surely will never be called upon to do that, Right?

> The overall reliability of and actual use of
> VHF has been well chronicled in the pages of QST and
> CQ magazine.

There will always be the need for these resources in all types and sizes of relief efforts. They are the more locally available parts of the system, depending on what parts of the infrastructure survive, amateur and otherwise.

The trend is toward "it has always been....." and so we will never need to plan for .....". Nature is fickle and will provide us with plenty of exceptions as time passes.

The best laid plans never cover nearly all the possibilities, generally just what is expected.

Heck, why don't we just eliminate the whole test altogether. Then we
would have even more HF ops and save even more lives....

David, WWII was considered an aberration in that it was total war,
IE there were wholesale attacks on civilian as well as military targets.
Historically, total war has not been the norm.

The warrior tradition is to spare non-combatants and commercially
valuable infrastructure. If you destroy what you intend to conquer,
you'll have very little to show for your efforts. The idea is to defeat the
enemy's military force so that you can subjugate his civil population
and turn his industry to your profit.

War has been defined as the extension of diplomacy by the controlled
application of force. Control is the key concept. The ideal is to bend the
opponent to your will, to make him do what you want him to do. You can't
do that if the enemy's assets are reduced to just rubble and dead workers.
That's just a barbaric sack, and isn't the way gentlemen settle their disputes.

That's why there has been such a push to develop precision munitions.
In the old days, men fought with the sword, bow, musket, or rifle. They
were precision weapons which could be directed to a specific target.
But the development of weapons of indiscriminate mass destruction
changed things. It was no longer possible to precisely destroy what
you wanted to destroy and spare that which you wanted to spare. That
turned war from a precision instrument of diplomacy to just an act of
barbarism and mass murder.

Total war is too dangerous to fight, and the rewards of victory are too
small. That's why nations have worked so hard to rein in the instruments
of mass destruction. They're trying to make it safe, and profitable, to fight
wars again.

Sure, they make mealy mouthed noises about peace and justice, but that's
just a cover. Peace is an aberration, just as total war is an aberration. The
natural order is tooth and claw. When animals of the same species fight,
they rarely fight to the death. When one gains dominance, or gains the
territory of the other, the fight is over. They don't attack each other's mates
and cubs to settle the dispute. To do so would be aberrant madness.

A pressurized room does you little good unless you intend
to stay in there indefinitely. Anthrax spores can remain in the
soil for decades. It is simpler to just get immunized against
the agents. Ask your doctor about immunization against anthrax
and plague.

No, high altitude bursts are relatively clean. To generate a lot of fallout,
you want a ground burst. That pulls lots of contaminated material up into
the atmosphere where it can be spread as fallout.

Doesn't the actual emergency have to be local to the tech?
Can a tech 100 miles away from the actual emergency operate
HF in assistance? Can a tech upstream from a flood who is giving
river depth rising water readings who is not in any danger himself,
operate on HF? I had always assumed the emergency had to be local
and immediate for a tech to operate on HF.

That statement just shows your gross ignorance of emergency operations. Emergency operations REQUIRE advance planning. Without advance planning, emergency operations are useless. As an example: How many of these emergency SSB operators can still do CW at what speed? Or any speed for that matter?

"No advance planning is ever needed" to find out who can still do CW? RIDICULOUS!!! That is the weak link in your CW theories. Half the coded hams can't do CW anymore. That's what happens with the "Once-Morsed, Always-Morsed" approach. If Morse code skill is worth having, it is worth being re-tested for at renewal time.

> All that is required is that all parties know that when
> conditions get so poor that SSB no longer is readable, they
> automatically switch to CW on the same frequency, and
> continue on until conditions improve enough to resume SSB
> contact.

It is ridiculous to expect a ham who took his code test 40 years ago and never used CW to jump in and do CW at a useful speed during an emergency. The emergency link will collapse.

> What requires such intensive "Integral" planning??? Answer:
> NOTHING!

You are assuming that everyone is as good at CW as you. That's an extremely rash assumption and is indicative of poor planning and inexperience. Are you going to slow the emergency communications down to 10wpm so I can copy? Or to 3wpm so everybody can copy?

This is a real problem but, in the future, with a 5 wpm General Class we could up the General pool from 122,000 to 340,000. And on the oddball outside chance that only cw would get through 5 wpm would suffice. It isn't the total solution but it is a step in the right direction.

Don't say that too loud. Army civil preparedness planning discounts
amateur radio as being too thin on the ground to be useful. They plan
to employ CB for ground truth augmentation because the operators
are thick enough on the ground. (Radio discipline ceases to be a
problem when you can line the troublemakers up against a wall
and shoot them.)

But what about particle radiation triggering high levels of secondary radiation in the tube itself? It seems this would cause some measure of improper operation within the tube. You are correct, however, a disconnected radio within a gaussian shield should survive, unless the shielding is poor, then some resonance could occur within the LC sections of the radio, creating havoc.

Probably shielded, otherwise you'll cook like a chicken in a microwave.

A tube is a capacitor, and in the onslaught of its antenna in a EMP storm, the plate, grid, and cathode connections will be overstressed in the current that results. Also, your high level weapon is illegal for any country to product. Designs currently available, even if detonated at high atmospheric levels, will still more than likely kill a population, or it will not be effective enough to trully devestate electronic infrastructure. Its much the same in theory of operation as a neutron bomb. Nice on paper, not wonder in the real world.

Source record: 21930

I have done some searching on the Web, but haven't found a definitive answers to this question. Is anyone doing amateur TCP/IP over HF?

Our local group already has an extensive 440 network along with some 900 Mhz spread spectrum nets as well. Up until now, we have been focusing most of our attention on the higher speed technologies. Some of us would like to experiment with some low speed, but long distance TCP/IP links, presumably over HF.

Are there currently any nets in place that we can link into?

A Tech, or a Novice, or an Unlicensed Person can operate on HF
all s/he wants, just as long as a properly-licensed control
operator is supervising said operation.

Hi Phil, by operating, I meant unsupervised operation. Assuming
unsupervised operation by a tech, how close to the tech does
the emergency have to be before he is authorized to operate on
HF all by himself?

The problem here is that man is unlike the animals in an essential way, he can conjecture all manner of reasons for genocide, we have lots of history of that ... some of it is visible in action today.

Some radical religious groups in the world promote the extermination of their opponents, and some of them have organized here in America. Hitler certainly promoted the extermination of certain peoples in WWII. Others are just plain mad and yet are bright enough to acquire or create biological and chemical weapons. The threat is profound, and more so since the Clintonian religion of selfishness and hyper-narcissism has swept this nation and others.

We are in real trouble and the old rules are largely null and void.

Cecil, I've often thought that there should be a place in amateur radio for MARS-like nets for emergency services. A person could become affiliated with an emergency services group and receive authorization/assignment for operating on one (1) net (several freqs), train on HF, participate in regularly scheduled nets, in hope that some of them would be available for bonafide emergencies. This authorization would not be for rag chewing, dx, contests, county collecting, etc. Just for emergency services and training for emergency services.

But I guess that this would be far too much privelege for undeserving no-code Techs who only want to serve! I know several nc-Techs who joined up only to serve, but because of the constant harassment, have dropped out. Real hard workers too! One was a real live, ns, motorola technician that offered to keep the unknowledgeable Extras repeaters in operation! Hah (I mean Hi)!

Thats right! Thats why our local EMS has 57 different response vehicles for
each kind of emergency. If the good Samaritan that called 911 cannot tell
insulin shock from hypothermia, then too bad for the victim. The wrong kind
of EMS vehicle shows up and the victim expires.

And this has what to do with Morse Code testing?

I have been inactive for a number of years due to job and family duties. I am excited again to setup my VHF IP station, and I am wondering what the current state of affairs is in Washington State? What bands/frequencies are best? What baud rates? Is HTML used? are there internet gateways available? Best LINUX version to use?

Does anyone have the e-mail address of, or can forward this message to, my IP coordinator KD7NM?

Thanks all who help

Not hard to find at all, just do a bit of searching and read the historical accounts of the New Madrid earthquakes of 1811-1821 wherin the earth shook for most of 3 months, during which time several quakes of >magnitude 8 occurred. Yes, I know...sparse populations and simple uncomplicated wooden buildings scattered thinnly throughout the middle of the continent in those days kept down the casualty count. Today, a replay of that series of events would creat a disaster of a magnitude not yet confronted by our disaster relief organizations anywhere.

Good reading on this subject is a book entitled "On Shaky Ground" by Robert Vance (or Nance, I've loaned out my copy) He goes into very detailed investigation of the many potential seismic hotspots in the USA and it turns out that 39 of the 48 CONUS states are at risk for serious or disastrous earthquake damage. It is very interesting to learn what scientists have discovered over the past few decades of how to determine where earthquakes are due and what level they might be.

They have discovered that a sure way to determine where an earthquake is due on a fault zone is to determine what area has not had one in many years but which lies between two other areas that have had more recent quakes. This is known as the "Seismic Gap" prediction theory. for the "gap" area between areas where more recent events are known to have occurred. Scientists who developed this theory have accurately predicted several quakes using this method including the Mexico City quake, and they say that a massive quake is due at Fort Tejon, on the San Andreas Fault, in the mountains several miles north of Los Angeles, which last experiecnced a large quake in 1857. The next Fort Tejon

quake is sure to pretty well devastate the entire Los
Angeles area, according to their predictions as recounted by
the author. Will all be well with disaster relief in LA when
this happens?

As I noted previosly, we HAVE NOT experienced a full
scale, wide area disaster at any time during the electronic
communications era. No one knows when we will. There have
been some large events, such as Hurricane Andrew where
relief was very late in arriving at many needed locations,
taking a week or more to arrive. Published reports indicate
a lot of disatisfaction with the relief effort by some
survivors who were pretty well left on their own for several
days. Somehow not much was ever published about
communications pertaining to these victims. I wonder why.

> > Literally millions of

> Probably nothing, but neither does CW on HF.

Certainly not, if no one knows how to use it. And one
would hope it would not be needed even if trained operators
were present and the mode was available for use. But can you
say what will be the situation?

> >How
> >do those persons/entities gearing up for a massive relief

> radio operator that is on CW.

Really? And how do you know this Bill? Sounds like you're
just convinced that there is no communications ability
whatever in CW.
What do you think it was used for during all those years
when it was THE mode of choice, there being no other?
No bias showing in your opinions is there?

> >Just because a recon aircraft pilot sees

> of the many earthquakes that have hit in California,

> the loss of communications has been sporadic
> and localized.

I thought you were the guy who is so high on 'Planning'.
What you read here is from extensive planning for just such
an event. One key element is the fact that no resource
within the disaster area can be expected to survive a major
earthquake. Few will survive. All relief must be planned to
come from the outside, and information as to where, what and
how much is vital. Hams within the area effected are
particularily well postioned to provide this vital
information.

If you will do even a LITTLE reading you will soon find
that scientists believe that California has never in the
Modern era experienced anything like a major earthquake
(including the San Franscisco quake of 1906 where by far the
worst of the damage was caused by the ensuing uncontrolled
fires which burned many trapped victims), The state is
certain to experience such a large scale quake at some
unknown time in the future. It could be tonight, anytime or
well into the future. There is no way to accurately predict
when, but the certainty of it occuring is clear.

Well, not exactly....I can't help your ignorance of
history nor the fact that you seem to believe all disasters
occurred after the inception of electronic communications
and well before the development of our metropolitian areas
which have almost universally ignored the threat and failed,
until recent times, to institute mitigation rules for
building construction. Most masonary buildings will NOT
survive,only a few which have lately been built specifically
to accomodate the earthquake motion without structural
disintegration.

What all this shows is the fact that the No COde Agenda
has for years planned CW OUR of planning. No one wants to be
seen to be so backward as to ever suggest using that "old"
stuff!

> As an example: How many of these emergency SSB operators
> can still do CW at what speed? Or any speed for that matter?

Good question. Each HF operator has qualified on Morse
code at some level. Of course those who scammed the CW exams
won't ever be able to serve as CW operators, anywhere.
You're saying that no ham should ever be expected to know CW
nor be able to use it in an emergency. I guess you feel that
is violating his 'rights'.

>
> "No advance planning is ever needed" to find out who can
> still do CW? RIDICULOUS!!! That is the weak link in your
> CW theories. Half the coded hams can't do CW anymore.

Ah, but that half stays home in emergencies, didn't you
hear the word from South Texas?

That's
> what happens with the "Once-Morsed, Always-Morsed" approach.
> If Morse code skill is worth having, it is worth being
> re-tested for at renewal time.

Suits me, but your No Code buddies might object.

>
> > All that is required is that all parties know that when

> years ago and never used CW to jump in and do CW at a
> useful speed during an emergency.

It's probably just as ridiculous to expect that ham to
even be present in an emergency. He's probably too busy
"doing digital stuff" or has dropped ham radio entirely but
kept up his license.

> > What requires such intensive "Integral" planning??? Answer:
> > NOTHING!
>
> You are assuming that everyone is as good at CW as you.

No, I'm assuming that licensed hams will be able to
recognize when someone is calling them on CW, even if it is
a voice link.

Even 5wpm CW is better than 0 wpm on any other mode.

> That's an extremely rash assumption and is indicative
> of poor planning and inexperience. Are you going to slow
> the emergency communications down to 10wpm so I can copy?
> Or to 3wpm so everybody can copy?

Poor planning is rampant, but mostly unrecognized by those
doing the planning. Too often it is not possible to
adequately plan for the unknown. Planners are mostly
bureaucrats, some are good at it some are no good at all. So
should we just trust to the system for all our needs? You
can do that if you want, but having seen it up close I
choose to keep to my own devices and standards.

Sooner or later you will grasp the meaning of the statement
that

>>ANY COMMUNICATIONS IS VASTLY SUPERIOR TO NO COMMUNICATIONS AT ALL<<

If hams accepted the responsibility of learning and
maintaining skill at using Morse code this would not be an
issue. Yes, I know, your code-hating engineer buddies at
Intel that you so badly want to let onto the HF bands will
have none of it. So you press on, trying to help get rid of
it.

The earth shock every day for 3 months???
Magnitude 8 earthquakes didn't happen every
day, now did they. How widespread was the
area?

Frankly, I believe there is and would be no reliance or
need for CW if it happened today.

>Yes, I know...sparse populations and simple uncomplicated

So what. California seems to respond quite well
today. Seems that's a great test area for emergency
preparedness. Likewise, the hurricane belt, etc.

> They have discovered that a sure way to determine where an

>this happens?

So how come you haven't studied any of these past
occurances to see where and how CW could/should
have been used? No, you want acceptance of a need
for CW knowledge based on ifs and maybes rather than
any objective analysis. Seems the real emergency
efforts don't subscribe to your claims.

> As I noted previosly, we HAVE NOT experienced a full
>scale, wide area disaster at any time during the electronic
>communications era. No one knows when we will.

Even the New Madrid is not a good example as there
is no actual seismic measurements from the time. The
estimates of earthquake impact is anecdotal rather than
very scientific.

I can say there won't be any such reliance on CW because
other modes will pand already do prevail in the planning for
such emergencies. If you can't convince the professionals
of a need for a CW back-up, then who do you expect
to convince?

>> >How
>> >do those persons/entities gearing up for a massive relief

>
> Really? And how do you know this Bill? Sounds like you're
>just convinced that there is no communications ability
>whatever in CW.

No, I state there is NOT any reliance on CW in any planning
for emergencies now. Those emergency plans ARE the
backbone of preparedness. Your claim or any expectation
that hams not already involved in emergency preparedness
will somehow become the ultimate saviors with CW is
most unlikly.

>What do you think it was used for during all those years

Bull. Earthquakes are very centered in major damage
areas. Just look to all those that have happened. Please
don't try to tell us that everyone and every element of
communications infrastructure in a given area (say 50
square miles) will be totally dead or destroyed.

>Few will survive. All relief must be planned to
>come from the outside, and information as to where, what and
>how much is vital. Hams within the area effected are

I thought you said few will survive. So what is it about
all the hams that gives them some special protection
from the death and destruction going on around them???
Why is the ham's radio station unharmed, but not police
radio systems?

> If you will do even a LITTLE reading you will soon find

Doesn't it seem vaguely unfair to grant a license to someone, expect them to train dilligently for emergencies, and then deny them participation in the fun things that ham radio has to offer?

If someone is willing to train for emergencies, pariticipate in scheduled nets, and seek to coordinate emergency response with other agencies, I really don't care very much if they ragchew, hunt dx, or whatever else their little hearts desire.

About 3 or 4 years back, there was some TCP/IP activity over ten meters,
and if I recall correctly, Arnie Coro used 10 meter TCP/IP to download
some software and discussed it over his R. Havanna show, Dxers Unlimited.
BTW, before the flames start, I suggest listening to CO2KK's show and

> We call them the National Guard.

In Missouri, where the epicenter of the New Madrid fault sits in the southeast corner of the state, throughout the '80s and into the '90s we did some SERIOUS planning for a major earthquake event on the New Madrid fault. Of course the Missouri National Guard was deeply involved and as a member of the state Public Safety communications staff working in the district in the south central part of the state, I worked closely with the Guard.(I retired in '94)

At that time the Guard had, at each Armory in the state, a HF SSB radio transciever on a statewide net running 100 watts (most had a 1kw amp available but it was never needed) and used B&W T2FD loaded broadband dipoles mounted atop the Armory roofs. The system worked very well at the 100 watt level. The net met each day on an 8 MHz frequency and I don't remember a time when I couldn't copy every station Q5.(we kept an authorized station on the net)

The plan was for a worst case scenario, that no resources would survive within the disaster area, the region bordering the Mississippi river and some 100 miles each side, and from above St Louis to below Memphis, Tn., essentially nothing of consequence would be left standing. No earthquake-hardened buildings nor facilities existed anywhere within that region.

Since no relief resources could be depended upon to exist within the affected area, all relief would have to come from the western part of the state and from states to the west.(All bridges across the Mississippi would be down in the river and areas east of the river would have their own relief effort to deal with anyway).

Mobilizing these resources would take from 24 to 48 hours, and transportation to the area would take more time.

Obviously a primary need would be for information from the disaster area pertaining to the exact locations of major concentrations of victims, their status and the nature of the relief needed, and where it would NOT be needed. What roads are passable and those not, where are bridges out, what are alternate routes to the points of most need, etc, etc.

My employer, the Missouri State Highway Patrol, as the only statewide law enforcement/public safety agency, was charged with maintaining order, providing communications, and was a major player in the early stages of the relief effort with emphasis on communications in gathering information to be used by the newly-mobilized units coming from the west. The district commander of the Patrol was designated as acting Governor for his district by law, in situations where natural disasters or other such events precluded communication with the state capitol, until such time that communication could be reestablished.

Since the disaster area was "out of service", the commander of the adjacent district immediately to the west was designated to absorb the affected area into his district for the duration. As chief of communications for the adjacent district, and later Field Engineer for both districts, I was responsible for trying to arrange communications and gather information in coordination with the Guard.

The one thing that stands out in my memory from all the activity involved in these planning sessions and drills, and extensive travel throughout the region, is the stark fact that for most areas, the very best you will be able to do will be very inadequate. Anyone who thinks that hams won't be badly needed has not had an opportunity to assess the potential situation and available resources with any thoroughness. But the hams must be ready.

Anyone who thinks that a planner would ever be retro enough to suggest or even *think* of using Morse code communications for *any* reason short of a last resort -no-other-available-means- communications mode is simply blockheaded. For a fact, it was never included in plans at all, and was never even considered to be a factor. In retrospect, that may have been an error of ommission. For when the existing resources in the region were inventoried, there just wasn't much to go with. A half dozen armories, a pair of Patrol low-VHF FM base stations and whatever mobile units survived,-that's assuming that ANY of it survived the quake. And whatever hams were available, having survived the quake themselves. ALL would have had their personal situations to deal with. If you think that I would've

refused to use CW just because it's that "Old anachronistic Luddite mode", you're nuts.

While travelling in the New Madrid region as a Field Engineer, I carried a balloon supported antenna that I made up, a coaxial colinear straight from the ARRL antenna manual, with a couple of weather baloons provided by the Guard and a 150ft length of RG58 parralled with a lightweight nyon cord, on a small reel. When I first built it we tried it with the aid of the Guard unit that did weather research who inflated the balloons for us, and gave us training in their inflation and use. It worked quite well and allowed me to communicate across most of half the state using a mobile 100 watt low-band FM voice transciever. I realized that I wouldn't need to carry helium to inflate the balloons as there are many novelty balloon vendors at flower shops in every town where one could obtain helium to use in an emergency. I also carried, in my van, an Icom 735 HF rig in a small suitcase, with enough accessories to make up a temporary HF station powered from the van's battery. It had an internal CW keyer, and yes, I carried a keyer paddle. Just in case it would ever be needed. Remember, I was travelling exactly in the area of the fault much of the time.

There's much more to this story, but it's way too long already. I haven't kept track of developments since I retired, so things may be much better now. I doubt it. I know they have acquired a flyaway sattelite terminal now which can be choppered to the area, but won't help with the initial communications needs and will be adversely affected by aftershocks.

Suffice to say it didn't happen on my watch, for which I'm very thankful. For when it does, to call it a huge mess will not adequately describe what is certain to result. But it could be worse-the district to the north has the Metro St.Louis area to deal with! Meanwhile, occasional magnitude 4+ shakes are a part of the routine along the fault.....

It was not an illogical statement. It was a logical statement
based on the posting that said that there was not enough HF
operators to handle the emergency flooding in Victoria, TX.

The Morse code requirement is keeping otherwise qualified
emergency operators off of HF - pure and simple. The Morse
code requirement is also keeping otherwise qualified RF/DSP/
digital (data and voice) designers off of HF. The Morse code
requirement does not filter out troublemakers. IMO, the Morse
code requirement does a lot more harm than it does good.

What is wrong with a free choice of modes in a hobby in a
free country?

Well, don't stop there, Dick. How about the meteor/comet that wiped out the dinosaurs? Heck, what about the Big Bang? We should force all citizens, not just hams, to learn Morse code in case we have another Big Bang.

Let me get this straight. You are willing to have each and every HF ham be coerced into learning Morse code just in case something happens like it happened 6 generations ago? If you could go back in time and equip all those New Madrid people with CW rigs and Morse code skill, how would it have changed anything?

I agree with you here, Cecil. I'm not anti-code, I just don't know (other than satisfying current international agreements) why we need to test for code to get on HF. Why do we test for Morse Code when we don't have a typing test for RTTY or a phonetics test for SSB? As for troublemakers, most of them have their Extra already :-)

I looked at TCP/IP on HF but the overhead is really too high for 300
bd links. Even on vhf the links are marginally fast enough and the
big problem with hf is that the path may only be open for short
periods. The tests I made showed that it was too slow to handle the
massive headers that build up on smtp. One message could take an
hour to pass.

We have *some* history of that. Rome versus Carthage comes immediately
to mind. But most wars aren't like that. In most cases, wars are fought as a
way for one state to impose its will on another, generally for some economic
or political advantage. The terms of the conflict may be cloaked in ideology
or religion as a propaganda tool to motivate the masses, but that's rarely
the underlying motivation.

>But what about particle radiation triggering high levels of secondary radiation in
>the tube itself? It seems this would cause some measure of improper operation
>within the tube.

Two factors make this of little concern. First, alpha radiation cannot penetrate the tube envelope, and most beta radiation can't either. Gamma can, but there has to be something for ionizing radiation to ionize, and a tube is mostly empty vacuum. The amount of secondary emission due to ionizing radiation impact on tube structures is insignificant. Tubes can be used around nuclear reactor cores because they are very immune to the effects of ionizing radiation. That's a higher radiation environment than any communications equipment will ever be exposed to in a nuclear war, except if it is *very* near ground zero, in which case the blast and heat pulse effects of the detonation make any concerns about ionizing radiation moot.

Solid state equipment is much more vulnerable to ionizing radiation. That's because solid state devices *aren't* mostly empty vacuum. The primary current carriers move in a semiconducting solid. When ionizing radiation hits *that*, there will be avalanche effects due to the sudden increase in free electrons and holes generated by the ionizing radiation. That will cause the device to heavily conduct, and it can be destroyed by excess current draw if operating at the time. It doesn't take a lot of shielding to prevent this, however, and good circuit design can limit the possible short circuit current to a safe value.

Even if not operating at the time, heavy exposure to ionizing radiation can puncture solid state device junctions, or permanently raise potential thresholds in memory devices, such that the device will be permanently damaged. This is a problem for satellite electronics due to the high and persistent radiation fluence in space, for example. But the radiation fluence has to be pretty high, or of pretty long duration, to do this, and any operator exposed to it would be toast too.

In summary, if the ionizing radiation exposure isn't enough to kill you, it is unlikely to kill your radio either.

>> It is my understanding that human beings can survive EMP that wipes out
>> electronics. Somebody correct me if I'm wrong.
>
>Probably shielded, otherwise you'll cook like a chicken in a microwave.

You might want to make some field strength calculations before saying that. The inverse square law is our friend. You also might want to consider how much cooking a chicken will do in a microwave that's only on for about 2

microseconds (duration of a NEMP surge). As you *should* know, since it is covered in the RF exposure regulations we're required to know, both field intensity and duration of exposure are vital factors in determining the effects of RF exposure, and of course NEMP is RF.

It is safe to say that there is no direct biological hazard from NEMP exposure. At distances from the detonation where direct blast and heat pulse effects won't harm you, NEMP intensity and duration will be insufficient to harm you either. There might be an indirect hazard in that NEMP could cause power and telco grid conductors to sideflash, and if you happened to be in the path of that sideflash you'd suffer much the same effects as from a lightning hit. But that's not a direct NEMP exposure effect. It is a darn good reason to supply adequate surge suppression on long conductors, however. Since you want that for protection against ordinary lightning strikes too, that's no inconvenience.

>But in any actual emergency, there is nothing wrong with
>having techs operate on HF (assuming the equipment to do so
>is there).

The problem is that without ordinary day to day authority to
use HF, there is very little likelyhood that techs would have
HF equipment when the need for it arises, or any hands on
experience in its use.

Propagation is different at HF, operating technique is somewhat
different, and the equipment is often quite different from the VHF
FM equipment with which most Techs have day to day experience.
(If you were a Tech who'd never been permitted on HF, what would
you do when faced by a TS520? Would you know how to tune it up?
Would you know *where* to tune it to reach a certain area? Etc.)

I'm not convinced that supplying ground truth reports falls
under 97.403 anyway. So a tech would have to operate under
the direct supervision of someone authorized to operate HF.
And if that's the case, then the person ordinarily authorized
might as well operate anyway.

The problem Harvey describes is that there aren't enough of
those HF operators or HF stations on the ground in the area
to carry out the mission properly. But there are a lot of Techs,
who if they had HF authority, would likely have the equipment
and hands on experience to carry out the mission. As Harvey
notes, CW skills weren't required in any event, so lack of same
would be no hinderance to the effectiveness of the operators.
But lack of day to day hands on experience with HF operation
would be a hinderance to their effectiveness.

Absolutely so. I think all amateurs should have to retest at renewal.
If something is necessary to know once, it should be necessary
to continue to know it. And with rapidly changing technology, it
is also necessary to keep up with the new developments that have
occurred since one was first licensed. Most fields requiring
certification require periodic recertification. Amateurs should
be no exception.

>the worst, poor efficiency and waste of critical
>effort/resources is sure to occur.

That's an accurate assessment of the situation. A large amount of ground truth information is needed to effectively coordinate a relief effort to a large area. A wide area disaster has two requirements for providing that level of ground truth. First and foremost it needs a *large* number of reporting stations distributed throughout the disaster area. Ground truth cannot be supplied unless there are on the spot reporters ready and able to communicate it.

This implies having a large number of communications assets on the ground in advance of the event. HF amateur radio operators are thin on the ground. This is perhaps the greatest obstacle which needs to be overcome if they are to play a significant role in this sort of emergency situation. As noted in the Texas floods, non-HF operators are relatively plentiful, but HF operators are in relative short supply.

And second, the volume of information required to be handled would necessarily be *huge*, and it must be routed and passed quickly, accurately, and in an orderly and efficient manner. If days worth of traffic starts backlogging in the system, the information becomes worthless. This implies the need for well organized networks capable of dealing quickly and effectively with large volumes of information.

Our current NTS system is totally inadequate for this. That's partially because it too is extremely thin on the ground, and partially because it uses antiquated methods of information handling which are totally

inadequate to deal with the volume of traffic required in a large scale event.

The information flow needed to respond to a large scale disaster is of the same magnitude as is needed by a theatre commander in combat. Large amounts of information must be handled in a time critical fashion in a hostile environment where normal civil infrastructure is mostly out of commission. So it is instructive to see how the military deals with this sort of communications tasking.

One thing we notice right away is that they don't depend on manual CW, even as a fallback position, because it simply isn't up to the task of handling the volume of information required in the timeframe available (outdated information can be worse than no information). So they take steps to harden, and make redundant, communications systems which are up to the task. Some of this CCC strengthening is technical in nature and some of it is organizational in nature.

Effective modern combat operations depend on a timely and accurate flow of information. The best army in the world is just a bunch of guys milling around if they are without clear coordination. The same is true for disaster response. Organizationally and technically, communications lines adequate to handle the flow of information must be established and maintained in the area of operations. Attempts to do that in an ad hoc fashion are likely to be unsuccessful. Careful prior planning and frequent training exercises are essential elements of any successful combat or emergency response communications system.

Depending on the making of random contacts among random stations with varying levels of emergency communications training is a recipe for a communications disaster. Every link and alternate route needs to be planned and exercised prior to the time it is needed. There should never be a doubt at any level as to what to do or how to do it. By and large, amateurs haven't done the planning or the training to provide an effective level of communications support for disasters of this magnitude.

I'd suggest that if you're concerned about the ability of amateurs to be able to respond to disasters of this nature, then you should be advocating that an amateur's time would be more wisely spent acquiring this sort of emergency communications training rather than in acquiring a facility with manual CW which is virtually certain to be inadequate to the task.

Dead on target! I did have one tech who had an HF rig and who used it under his own initiative to pass a critical message while I was unavailable (asleep!). The rest had neither the gear nor the skills needed to work effectively. As you point out, if I was available to supervise, I would be available to do the job myself.
Before someone makes the accusation, I am NOT against CW, I'm just against forcing someone to learn a skill which is no longer ESSENTIAL to the license.

Harvey, WB5MCT

4582. Newbie with question on SSTV

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-27 00:00:00 UTC
From: Michael Adams <M_Adams_nospam@msn.com>
Message-ID: <7164c5$7b8$1@fir.prod.itd.earthlink.net>
Source record: 21774

I am new to slow scan television on HF. I read a recent article in QST, which showed how a simple circuit connected to a personal computer with a freeware software package could be used to receive Color FAX480.

My question is...is FAX480 the predominent SSTV mode, or do I really need a modem to pick up most SSTV signals?

Thanks,

Michael Adams

> HF all by himself?

I don't think it would be a matter of how close it is. It would be a matter of the type of communication. The term "emergency communication" is rather vague. That could mean distress calls, urgent calls, disaster recovery, I guess even health and welfare traffic from a disaster area.

All of the amateur rules go out the window for distress communications. But distress communications are those related to the *immediate* threat to life or property. A no-code tech could place a mayday call on any amateur frequency if he was in such a situation. And a no-code tech could answer a mayday call on any amateur frequency if no one else did.

If you are talking about disaster recovery (a net), I don't think a no-code tech could participate on HF as a control operator. I doubt that disaster recovery would be "distress" communications.

>Alas, AX.25 on HF is pretty much a lost cause for even keyboard QSO,
>let alone as a data pipe.

I played with TCP/IP on 40 meters, about 5 years ago. There were a number
of operators in 4 land that I attempted to communicate with. I was loathe
to give it up but the overhead, long packets, and differences in
configurations between stations made it an exercise in futility. Selective
fading, qrn, qrm, etc. would lower the probability of successfull reception of
a long packet to zero, for days at a time. I was running 100 watts to a 75
meter open wire fed dipole at 33' above ground. At times Communication did
occur, but at such a slow pace, it was criminal.

I played with 40 meter bbs's, passing identical message text as using TCP/IP
to get a subjective, but reasonable idea of the difference to plain ol' AX.25
with paclens appropriate for the conditions. AX25, as poor as it is, was
magnitudes better than my best effort with TCP/IP.

I suspect that TCP/IP operation in higher frequency bands, under stable
conditions, would make a closer contender, but hf is seldom as stable, and
free of selective fading, qrn, and qrm as the vhf and higher bands.

If you want an experience, fraught with frustration and disappoinment, press
on... ;-)

FAX480 is rarely used for SSTV. The dominant modes in the US are
Scottie 1 and 2. The dominant mode elsewhere is Martin 1.

You don't need a modem, but you do need some kind of interface. Until
recently, most of the freeware/shareware programs required a simple
interface made with a few diodes, capacitors, and resistors (e.g., the
Hamcomm interface). More and more, SSTV software uses sound cards, and
this method works very well.

Other posters to this newsgroup have recommended web sites for you to
read up on SSTV. Of those mentioned, I recommend the ultranet and the
siliconpixels sites.

>
> 73 de Dick, N1SJM

Yes, yes, but they seem intent on focusing attention on a single
entry-level license and enhancing the privileges a bit. Since we are
losing membership it sounds like a good idea.

Keeping our somewhat protected status will require three things:
1. Intentionally enhancing the size and quality of our emergency
preparedness role
2. Intentionally enhancing the training and preparation of young people
for careers in military
and commercial communications and technology.
3. Aggressive rules enforcement (we have just seen an example, but it
required aggressive and
unrelenting lobbying of the FCC to get action, and no I am not a
member of the qrm'ed net)

Failing this we will see more hams lost, bands lost to commercial
interests, and fewer protections against local government interference with
towers and antennas.

We should request a clarification from the FCC as to the threshold
necessary for a waiver permitting a Tech-Plus (or novice) to operate 80,
40, 20m during declared emergencies.

We have weak areas that we need to address, let's get to it!

New Madrid was no joke. The Mississippi River ran *backwards*
for three days. Considering the flow of the Mississippi, that should
give you some idea of the amount of displacement that had to occur.
This was the really Big One in the Midwest. Church bells rang as far
away as Boston. This was *not* the sort of localized quake that
California suffers. The fault rupture was very long. Heavy damage
occurred over an area that now includes parts of Arkansas, Illinois,
Indiana, Kentucky, Missouri, and Tennessee.

There was a big scare back about a decade ago when a prediction
was made that the fault was due to let go again. There are now
millions of people in the area, and the effect of a recurrence would
be devastating. Fortunately, the prediction missed, and the fault
didn't let go, but it got a lot of EMA types to do some hard thinking
about what they'd have to do if it ever did let go again in such a
dramatic fashion.

That thinking does *not* include amateurs using CW, however.
Dick is very much alone with that idea. One might as well plan
to use the Pony Express. Its utility would be about the same in
a disaster of that scope (which is to say, while not zero, so close
to zero as to not matter).

Hi folks,

* What is Hellschreiber?
* Have you looked into operating Hellschreiber on HF at all?
* Do any of your present HF modes offer the ability to change speeds or fonts to show your individuality?
* Would you like to use foreign langage (non-English) fonts?
* Do you have trouble communicating on noisy bands, or with modest equipment?

Take a look at Hellschreiber!

There are two main forms in use - the traditional 1926 vintage Feld-Hell, which is on-off keyed like fast CW, and Multi-Tone Hell, which is a frequency domain mode. Both modes are UNCODED - which means that noise and other errors may distort the text, but cannot change it to anything else. These modes are designed to be read and interpreted by eye, not machine.

Both modes offer high performance, given the simplicity of equipment required. Both modes are very good at rejecting interference and are ideally suited to noisy bands. MT-Hell also has a unique ability to reject QSB related timing errors and selective fading that plague FSK modes like RTTY - MT-Hell requires no synchronism.

If you have an HF rig, and a Win95 computer with a sound card, you likely have all you need! There is also excellent software for the EVM56002 DSP kit.

There are about 30 - 40 Hell users world-wide at present, and world-wide contacts have been made, many under conditions where contacts in SSB and some other digital modes would not be possible. We desperately need more stations to talk to - so far most are in Europe, and there are only two in the US.

If you would like to learn more, take a look at the "Fuzzy Modes" web site:

http://members.xoom.com/ZL1BPU/Contents.html

Everything you need in the way of software is on the web site.

Isn't it interesting that only those adamantly intent on retaining the
archaic Morse speed tests are advocating eliminating those test elements
Part 97 says are designed to determine if an applicant is sufficiently
knowledgeable to operate safely and legally. Apparently it is true that
high speed Morse leads to brain damage.

Well, the FCC proposal looks as though it will result in an entry-level license that will include HF voice on 10m. This being the case we know that most will buy a 160-10m, 160-6m, or older 80-10m HF rig with every intention of upgrading. Meanwhile they will learn HF operating on 10m and posses the necessary rig with which they are familiar enough to be useful in an emergency.

And we should run regular emergency preparedness Nets, and perhaps a big traffic-handling contest, on 10m to be sure.

Let's press the FCC to "make it so"! 73, DavidC AA1FA

I wrote a program to calculate the number of sections for a given roll off
and total rejection of a given frequency turn over point. The filters are
Bode phase flat filters and are Ok for colour TV.
The component values are given and all sections are identical.
To make a bandpass filter you run the program twice one for high pass and
the other for low pass then you can make the top as flat as you like for the
band that you want.
You can choose the impedance that you want to use.

I have built a number of filters using this program and they have all
measured out to spec first time around.

They are passive filters and have a very low insertion loss in the pass
band.
Typically under a dB

I have Translated the Original Fortran program into BBC Basic and that gives
identical results.

I haven't a copy compiled but I can give you the source in either Fortran or
Basic if I can fish out my old note books.

You can only achieve 6 dB per octave roll off per section but the program
tells you how many sections to use.

On a practical note each section should be in it's own screened compartment
so that there is no bleeding by stray capacitance for the higher
frequencies.
If you are interested E-Mail me and I'll sort the stuff out from my junk
pile.

The filters include a resistive element which helps to dissipate the
unwanted frequencies. Something which most passive filters do not take into
account.

Sounds like you were trying to use AX25 UI frames at the link level and thus had to depend on the TCP timers for ARQ. That certainly isn't satisfactory for HF operation, though it can work acceptably at VHF/UHF. The TCP timers aren't intended to be used that way. As Steve notes, you have to use VC mode and let AX25 do segmentation and retries when operating on a very lossy channel like HF. When you do that, TCP/IP over AX25 works just as well/poorly as plain AX25 does used alone.

What you really need on HF is a more robust link level protocol. For example, if you use Clover II as the link level protocol, you can then run TCP/IP over that without all the problems you have when trying to run it over the inferior AX25 link level. It is still slow, of course, since the channel capacity is low, but since Clover gives you a robust link level, TCP/IP works over it just as well as it works over a slow wireline link. If you use VJ header compression, it actually works pretty well. Interactive telnet sessions are a pain, of course, but smtp mail and ftp file transfers work fine.

You've got to remember that in the days when TCP/IP was developed,
300 baud telco links were standard. We tend to forget how slowly things
worked in those days because we've become spoiled by 56 kb modems
and ethernets. But they're still that slow on HF, slower actually because
we operate half duplex and the channel is noisy. That's the limitation,
not TCP/IP.

TCP/IP is merely our network level router and session transport. If we
don't require routing, and if we are only running one application, and
thus don't need session transport, then we don't need to use TCP/IP.
Raw link level delivers everything we need. But if we are part of a network,
or are doing multiple sessions, then we need TCP/IP very badly indeed.
We need to remember what purposes TCP/IP is designed to serve
and apply it accordingly.

We can use it on slow links if we must, but we need a more robust
link level than AX25 UI frames on HF. The link level has to be good
enough that the TCP timers rarely are called upon to request a TCP
level retry. Those timers are intended to ensure host to host integrity,
not link level integrity. The assumption is that either the physical layer
is virtually error free, or that the link level protocol used makes it
virtually error free to the network and session layers above the link
layer.

A lot of the bad rap that TCP/IP over radio has received is due to a lack
of understanding of this fact. The problem is not TCP/IP, the problem is
trying to use AX25 UI frames for the link level on an error prone channel.
You can't get away with that. The link level must be robust. The TCP
timers aren't intended to do link level ARQ. It is a tribute to the robustness
of TCP/IP that they can be misused that way and still get data through,
but performance will really suck.

There was a post recently about this. Unfortunately when I tried it, it didn't work.The 'MA' and 'SP' pads on the board aren't connected to anything. So if the original
poster could check his board, maybe he could tell us where they come from???

I must say as an old RTTYer, I was dismayed there was no scope output as standard,
but really, the LED display isn't too bad for tuning.

Hello all,

Has anybody managed to make the KAM operate in AUTOPRINT mode in RTTY?
(AUTOPRINT is the ability to stop printing garbage when there are no valid
MARK and SPACE tones on the air)

I asked kantronics but they told me that I should perhaps switch to AM
at the front of the KAM. But this apart from not working, it is definately
NOT AUTOPRINT.

Any ideas would be much appreciated!!!

I didn't think we had so much of our nuclear capability dismantled, just the ICBM delivered stuff. I thought much of our aircraft delivered weaponry (some of the heaviest available) was very much alive and kicking. Hence the continuation of many of our stealth aircraft projects. I remember reading about several plane mounted devices that were designed to penetrate and destroy Russia's equivalent to NORAD that were capable of yields in the 200MT range. Popular Science used to cover all sorts of nuclear weaponry during the early eighties.

I doubt seriously even multiple 3rd world countries would want to target us. Their missles are just coming to the point where they are viable within their own continents, much less cross an ocean reliably. After the 4 or 5 warheads go off in the US, given 100% accuracy, our retaliation would more than likely be swift and brutal enough to discourage any further attacks from any other parties.

On your comment of biological weapons, the US considers bio weapons to be weapons of mass destruction. Given we no longer play with biological weapons in conflicts (or so we say), a bio attack on us would be grounds for nuclear

retaliation.

What you really need to be concerned about is terrorist attacks involving nuclear and biological weapons. Terrorists typically can't be found to punish, whether because the play a macrocosm on a microcosmic level or they choose to become martyrs for their own cause. Frankly, they just don't give a damn. Even a trunk mounted "fizzling" nuclear device can kill 100's of thousands of people instantly, and their poisoning of the environment has been theorized to be much worse than a well designed weapon of the same size (though instantaneous destructive capability is much lower).

David

The tubes you and I buy are not radiation hardened. These tubes also contain gases at low pressure (a very minimum, but it is present). It is quite conceivable that should a tube be exposed to high powered radiation (such as a nuke), the secondary radiation generated by the activated plate could cause problems in terms of noise performance, which of course, affects the entire radio.

>
> And the "higher resistance to static electricity" that you mention

> operating or not.

Static electricity and EMP are drastically different. Static electricity doesn't move well, hence currents aren't generated until certain potentials are reached.In MOS semiconductors, the breach can be fatal as it will puncture the glass insulator that separates the gate from the rest of the transistor. There aren't many similarly delicate parts in a tube receiver. However, the field of a nuclear weapon is equal with that of

being within close proximity of lightening strike, perhaps even worse. Lightening fields can destroy destroy tube equipment. I'm sure several people here can easily vouch for that.

To give a picture of what it takes to destroy electronics, lightening need not strike most any dwelling directly to affect electronics contained within a dwelling. I got my first hard and fast lesson in EMP from a mere summer storm lightening strike. A computer that was approximately 25 feet away from a lightening hit to the ground, had surviving internal parts. What fried were components involved with external IO, ie the mouse, keyboard and modem. The machine would boot perfectly, there were no bad sectors on the drive, and the floppy still works, but the IO components involved with the mouse and keyboard on the motherboard were fried, as were the components in the MWave card. I chose to only salvage the drives and processor (which has several voltage regulators and coils between it and oblivion). The motherboard was irrepairable in terms of my only average compliment of soldering equipement. Bear in mind the computer had both its phone line and its power connections all surge protected, and the there was no indication at all any surge passed through via the PS.

This real observation would suggest that within only 3 feet, enough power was inducted into the puny wiring between these peripherals to exceed 20 volts and what I would guess to be several amps. Now how big are those high voltage coils in a tube rig????????? Also, how long is that Coax connection to the rough? How about how much power the antenna is going to channel right down the Coax? I'd bet your tube equipment, if not shielded, would be just as toasted as its neighboring semiconductor piece. In addition to this fact, I do not know of many people who use radio equipment who can afford and have extra tube equipment to strategically store around in cubby holes (unused) in case of nuclear war.

You could purchase the high priced equipment Gary Coffman recommends and protect your equipment from EMP getting in the antenna system, but what good would that do in the case the radio itself is exposed to the same fields?

One other interesting factoid. Thorium oxides (or dioxides, can't remember which), used in tube cathodes as a electron donor coating, are susceptible to isotopic changes when placed under a high doseage of particle radiation such as would be present in a nuclear blast (the thorium component of the oxide, that is). One things for sure, you can't generate electrons if the new chemical that results after blast is incapable of generating electrons as effectively as thorium. For those who don't know, thorium is part of the coating of the cathode that allows electron generation to acheive operational levels. I would say that plays a VERY large part in how the nuclear radiation of a blast effects the tube rig as we know it. Plus who can say what damage the filament will take on itself from the fast fissioning of the thorium, plus possible resonances from EMP in the transformer circuitry inline with the filaments? Maybe with the radioactivity that results, you will not need filaments anymore.

"Hey man, my rig uses beta particles for amplification".

No need to grasp at straws, I am convinced tube equipment would provide no great advantage at all in a nuclear war, unless you store alot of backup gear in underground fallout shelters or live a good ways away from strike zones, with either condition in conjunction with the hopes no one will detonate a device high in the atmosphere.

I agree with Pat, N0ZO to try 8N1.

If that doesn't work, try the other speeds. Set your Hyperterminal
to 2400, 4800, or 9600. One of them should work with either
7E1 or 8N1.

So that gives you 8 combinations to work with.

Demetre,

I have used the "autoprint" function... but it requires the reception of a SELCAL sequence to unlock the squelch. This means that it is practically useless for casual monitoring... unless you know a sequence of characters which are sent before a message.

For example, we send something like "BASE BASE BASE de MOBILE...", the KAM+ unlocks after the first BASE sequence. You can program the KAM+ to respond to other SELCALs (MYAUTOS is the command).
Unfortunately, RTTY is a dumb mode with no error correction... so noise is "normal" (always had that... even with my first Lorenz 15 + TU, my Kantronics UTU, my KAM+ and DSP2232 modems).

Good Luck,

Well said, Gary, from one that understands the game better than me. The
point that I attempted to make was not so much that it could not be done
better, but that regardless of how I configured my end using vc, segmentation,
etc., as soon as the link was established humongous packets issued forth from
the station "connected to", bbs welcome messages for example, that it might
well take days? before the sign on sequence was completed.

On vhf, locally, with no qrm, qrn, multipath, selective fading etc,
communications with a similar setup was a shoo in. As was touched on by Steve
and you, it is possible to maximize data transfer in the hf rf environment,
but the problem experienced by me was that those with whom
I wished to communicate were doing everything correctly... ;-) That insured
communications were not going to get better than lousy

If I connected to the xNOS bbs using plain jane AX25 and a terminal program,
those same huge packets issueing forth from the bbs would invariably force a
time out because except for the best of conditions a hole would be punched in
the data by some propagation or environmental rf phenomenon.

You were being charitable to state that performance "really sucked".

I've got something similar integrated into another product. It uses the
WebBrowser control in VB to render the pages, and sends commands to fetch
the pages to a server, which then connects to the server, downloads the
page, then sends the HTML over packet to the client.

It's pretty slow at the moment, but I plan to add compression to it to make
it faster.

After regretting the sale of my Icom PCR-1000 last year, I decided to get another one. Now I need to come up to speed on what's new, i.e.; hardware, software, frequency databases, modifications, etc.

Thanks in advance for any advice!

Sincerely,
Bill Crocker

Hey, are you distributing the source code or have an downloadable executable? Sounds like a good idea, but I would recomend using a coder that would compress HTML tags into 1 or 2 byte codes and then run a text compressor on top of that. I would be happy to modifiy the code for the HTML compression and maybe the text compression too. Another sugestion I have be not to use AX25 for the connects over packet.

>the original
>poster could check his board, maybe he could tell us where they come from???

It was most likely my post you read about connecting the KAM for scope
use, so please allow me to explain.

There are two sets of "MA" and "SP" pads, one set near the connector
on the rear and one set toward the front and off to the side. The
rear ones are the ones not connected to anything as it comes from the
factory. They can be used as a tie point for the recommended
resistors if you like. The set near the front and off to the side is
the source of the signals. Hope this clears up the confusion. Here
is my original post for those who missed it:

The procedure is essentially the same for all KAM versions, but there
are slight differences in the layout of the pc board. Basically what
you do is to install two jumpers (just plain insulated wire) and two
100k ohm resistors, one is series with each wire. I'll just describe
what needs to go where and you will have to figure out exactly how to
do it depending on your particular version.

After you remove the cabinet, you'll see a pair of pads on the board
near the front and off to one side marked MA and SP. The MA has to be
connected through a 100k resistor to pin 11 of the DB-25 connector,
and the SP likewise through another 100k to pin 18. The difference
between versions is in exactly how you do that. (I'm going from
memory now, so cut me a little slack here). On later versions, you
can trace the wiring back from pins 11 and 18 to the board, and you'll
find a place to install the resistor right on the board. On older
versions, there isn't a place directly on the board, so you'll have to

kind of suspend the resistor in mid-air where it connects to the jumper going to MA or SP. However it mounts physically, the electrical connection is the same. You'll also need a ground connection to the scope which you can either make to the ground pin on the DB-25 if you don't mind having two wires at one pin, or you could run it to any convenient point on the chassis, such as a screw on the connector, or you could add a nut and bolt somewhere on the back panel.

After doing all this, you just connect the MA output to the X input on your scope and the SP to the Y input. The output is about 1 volt p-p, so set your scope's input sensitivity accordingly.

As the KAM manual points out, the 100k resistors are not absolutely necessary (you could just have a jumper wire direct) but they serve as protection to the KAM in case any voltage is accidentally applied to pin 11 or 18. If you're absolutely sure that will never happen, eliminate them and just install the jumper direct. Personally, I put them in just to be safe, although I can't imagine how voltage would EVER get applied there. Murphy is alive and well, though....

Good luck, and if you need more help or information, let me know.

73, Bill W7TI

>What of high energy neutron and gamma radiation on the thorium coated cathode?

The nuclear cross section of thorium is low, which is why you have to use thermalized
neutrons in a reactor burning thorium (see Candu design). Fast neutrons don't have much
chance of causing fission chains in thorium. The only effect of gamma on thorium is a bit
of
added heating. You should also realize that only some tubes use a thoriated cathode, and
even in those that do, the percentage of thorium in the tungsten matrix is less than 1.5%.
Many tubes use a barium oxide cathode because it has higher emission for a given heater
power than a thoriated cathode. Thoriated cathodes are usually restricted to tubes
operating
at high peak to average current ratios. That can damage an oxide cathode by a process
called stripping.

BTW as a historical tidbit, ARPA funded the development of tube ICs back in the
early 1960s. They were called TIMS for Thermally Integrated ModuleS by GE (the
prime contractor). The entire module was heated for operation (hence the name).
The reason they were developed was for operation in high radiation environments,
such as aboard spacecraft and around nuclear reactor cores. They worked quite
well, and were really fast logic elements for their day, but the rapid advance of solid
state electronics, and in particular the rad hard SOS (Silicon On Sapphire) technology
developed by rival RCA, put a premature end to what was a promising technology.

Realize that any tube at operating temperature *already* has any gases inside
fully ionized. Tubes employ "getters" to reduce the amount of gas in them to a
very low level so that the ionized gas won't cause problems. Since any gas in
the tube is already ionized, your point is moot.

BTW, I've never heard of a special radiation hardened tube. AFAIK, all tubes
are rad hard right out of the box. You might consider that the one thing we
don't worry about with communications satellites is the rad hardness of
the TWTs in the transponders.

Well, any link level protocol which requires a deliberate "over" won't
easily work. That's why I like Clover for this use. It is "quasi-duplex"
in that no special action has to be taken to turn the link around. But
AMTOR, PACTOR, and PACTOR II do require a deliberate "over",
and that makes things complicated. I don't know enough about
GTOR to say what problems might arise with using it as a link
level.

There are a couple of trellis coded streaming protocols being
experimented with in amateur radio that might be attractive.
I don't know too much about the details of their link management,
however. One of them might be just what we're looking for. They
use simple PSK modulation and depend on the high degree of
FEC provided by trellis coding to keep the error rate low. They
have the charm that the longer the message, the lower the
chance of an uncorrected error (up to a certain length, 2^64
bits in one scheme).

The hardware is simple and the complexity is hidden in the
firmware, so they should be pretty cheap to implement. I
have a feeling, however that you'd need to set up true duplex
RF links to use them for TCP/IP, otherwise you wouldn't get
the full benefit of their brand of FEC, and that'd be hard on HF.

Dies ist eine Kopie von einer Message aus alt.radio.scanner:

From:
Dennis Cain <wedge@gate.net>

Di 04:35

Subject:
Alternate ICOM PCR-1000 Software

Here are websites with the best software that I have been able to find
for the ICOM Pcr-1000.

(Sorry ICOM, your software sucks)

This is Patrick Masotta's home page (This guy is my hero...)
http://members.tripod.com/~pcr1000/index.html

This is a cool site that has a program called "Pcrscope" Very nice
proggie!
http://208.133.53.38/pcr1000.html

This is another great site, for a great proggie. The program is called
"Talkpcr".
http://www.mahy.demon.co.uk/

Of course the list would'nt be complete without mentioning:
http://www.scancat.com
as soon as this guy gets online ordering, im gonna give him some buckies

for his great software.

A great DOS based PCR control program here:
http://www.bigbear.net/users/rransom/pcr.htm

These proggies I tried, and did'nt like (Or I could'nt get to work)
)-:
Visual Radio
SHOC radio

Come on guys! Get writing some more software!!! I need a free frequency
conversion program!
ICOM and these godd**n .MCH mother***kers!!!

Know of any good software for this neat little black box???

mailto:wedge@gate.net

Maybe the WR1500e (external) is a good choice. But I have not seen one personally. It costs much more than the WR1000 but maybe it has more possibilities for upgrading with better IF-filters and other components.

In addition a sample of some postings I did before. Some of them are in german (excuse me) but there are lots of germans reading this NG too (as

I do).

Wenn Du mit dem Gedanken spielen solltest mal an der Hardware was ï¿½ndern

zu wollen (bessere Filter fï¿½r SSB-Empfang auf Kurzwelle z.B.) vergiss es.
Aber fï¿½r "normalen" Rundfunkempfang und SSB-Empfang des Amateurfunks auf

Kurzwelle reichts - in etwa vergleichbar mit dem Sony 2001D. Im VHF/UHF-

Bereich ist das Teil spitze. Inzwischen gibt es auch zusï¿½tzliche Software fï¿½r den PCR.Fï¿½r weitere Info mail an mich und schau in das PCR1000-Archiv bei http://www.qth.net
und abonnier es.

Was die Empfangssituation angeht bin ich hier mitten in Berlin sehr abwechslungsreichen Bedingungen ausgesetzt. Au der einen Seite ist auf allen Frequenzen ne Menge los, andererseits gibts aber auch ne Menge QRN. Bis jetzt habe ich auch nur eine Behelfslï¿½sung "ï¿½bergangsdauerlï¿½sung_> :-)))" die aber recht vernï¿½nftig arbeitet. Ich benutze z.Zt. eine DV-lang CB-Funk-Antenne ca 2,7 mtr lang und habe die Alukaschierung der Dachbodenisolierung mit dem Maseanschluï¿½ des Antennenfuï¿½es verbunden- ist im 6. Obergeschoï¿½ ungeheuer wirksam! Damit ist passabler Kurzwellenempfang genauso mï¿½glich wie Amateurfunk auf 70 cm. Die Zuleitung zu meinem Shack im EG ist 25 mtr RG213-Kabel. Selbst bei dieser kurzen Antenne empfiehlt sich fï¿½r KW unbedingt ein Antennentuner/Preselector fï¿½r eine Vorselektion!

Der TNC-Anschluï¿½ ist ein FM-Diskriminatorausgang. D.h. daï¿½ Du hier das unbegrenzte FM-Signal zur Verfï¿½gung hast um digitale Signale abzunehmen und zu dekodieren, die den Frequenzlimiter der NF-Verstï¿½rkerstufe nicht "vertragen". Dazu gehï¿½ren z.B. Packetradio-Signale ab 9600 Bd und hï¿½her.

Um solche Signale zu verarbeiten braucht man entweder einen TNC (das ist

sozusagen ein kleiner Spezialcomputer der zwischen Empfï¿½nger und PC zwischengeschaltet wird um Packetradiosignale gezielt zu verarbeiten und

bei ausgeschaltetem PC zwischenzuspeichern), oder einen Analog/Digitalwandler (gibts in verschiedenen Ausfï¿½hrungen um digitale Signale u.a. auch CW, Fax, RTTY, POCSAG usw.in COM-Port-verstï¿½ndliche Signale zu wandeln).Diese haben aber keinen eigenen Speicher und sind auf "mitlaufen" des Computers angewiesen) oder sogar die Soundkarte (die

ist ja im Prinzip auch nichts anderes als ein duplexfï¿½higer Analog/Digitalwandler) angeschlosen. Welche Hard- und Software man zur decodierung einsetzt entscheidet im wesentlichen der Geldbeutel. In der neuesten Ausgabe von *Radiohï¿½ren und Scannen (9/98)* wird eine

hochinterressante Hard-und Software-Kombination vorgestellt:
Radio-Com_3.0 die fï¿½r den Preis von DM 358.00 wirklich sensationelles
leistet.

have a look at www://qth.net and have a look at the PCR1000 archieve
there and subscribe.

In my opinion it`s one of the best price-worth receiver. You will NOT
call it a specialist for scanning although it has some
scanning-functions. By ICOM its called a communications-receiver.
Performance on HF is a little bit better as the unmodified Sony ICF2001D

/2010. A modified 2001D with better IF-filters maybe better in some
cases. For receiving (mainly) on shortwave (so do I) the UT106 DSP-unit
is highly recommended. A big fault by ICOM are the 450khz IF-filters.
There are NONE better available around the whole world. I am now trying

to get a pair of new 450 khz-filters with 2.8khz bandwidth from my
ICOM-dealer as repair-parts. I want to switch them behind the other with

an amplifier-circuit to get a better shapefactor. On VHF/UHF it has an
exellent erformance. The Packet-Radio-connector is the
DISCRIMINATOR-output and very usefull for some digital decodings. But-
forget the antenne that comes with the PCR1000. A discone OUTSIDE the
house with UHF-whip is for shure the best you can do to this receiver.
With longer antennas on UHF it will overload. Even with that short
antenna an preselector like the YAESU FRT 7700 is very usefull.

At first: give your PCR1000 a good outdoor/rooftop (discone-)antenna
with a HF-whip. Use double-shielded low-loss cable. For use on HF a
preselektor is recommended because of overloading the frontend. Do a
research on the PCR-1000 archieve of the last few month and you will
find a lot of stuff and adresses for download. But BEFORE playing around

with ex-2099 do a EEPROM-backup with backPCR or PCRbur.

When anybody KNOWS (securely) an Manufacturer who builds 450khz
IF-filters with bandwidth less than 2,8khz and an acceptable shapefaktor

of 2.5 or better please post it or send me email. With two additional
filters of 300/500 and 1800/2200 Hertz it would be the very best
receiver for shortwave you could get for this low price. BUT WHERE TO
GET ??

Iï¿½ve changed some IF-filters in the ICOM PCR1000. I changed the
6khz-type to a 4khz (MURATA CFWS450IT) and put the 6khz to the holes of
the 15khz. In near future I will change it to a 9khz-type. For 15khz I
do not see real need. But this changes seem to give better receiving on
shortwave.

Is there anybody able to give a patch-program to me AND the group where
I can can give my own filter-specifications to for upgrading the
original ICOM-soft?(Ver 1.31)

Yes I have some experiences and I will tell you.
Until now I work a 1/4 wavelength CB-Antenna for all frequencys on the 6th floor under the roof of the house. Cable is 25 meters of RG213 to my

shack on ground-floor. I mainly receive on shortwave and sometimes on 4meter-band and to the HAMs on 2meter and 70 centimeter. There this antenna works very fine. It has a good "grounding" of appr.10x8 meters of metal-foil from the isolation. On shortwave I use a YAESU FRT 7700 preselector and it is VERY useful because of overloading the frontend with the "big guns" when receiving on HAM-bands or utility-stations. You

can still get the FRT7700 for new about her in Germany for less than DM 200,--
and sometimes used ones for half the price. In near future I will connect a discone and a FD4 longwire to my cable, switchable with an remote-controlled relay. All under the rooftop because I will not be allowed to go outside with my antennas. Go at least 10 meters away from your computer with a good shielded cable to connect an antenna!
My computer is a bigtower under my desk and the PCR1000 is in a rack over the monitor. I have ALL cables (low-voltage to the PCR, monitor-signal-cable and serial-cables also) exept the HF-wires :-)) fitted with toroids.
But I have still some marks every 75khz on HF but very low. Maybe it comes from the computer or from inside the PCR itself. The DSP works very fine on voice (do not use it with music!!) and in the HAM-bands. But I miss some functions for the digital modes like adjustable upper and lower frequency (bandpass) and peak/doublepeak-filters for CW, RTTY,

FAX and so. But its worth the price, some SSB-transmissions are only readable with DSP active.
An external DSP with all the functions I want costs the same as the whole PCR1000. :-((

I sent an email to ICOM some months ago and got a reply (automatically??)
that they received my comments but never get an answer if they would change something with the DSP-soft or with the IF-filters nor what they want to do with the 2nd additional port inside.

Ich habe eine Kopie des (grossen englischen) Manuals (als scan auf Datentrï¿½ger 25! MB)und die Kalibriersoft(2,6 MB). Bei Bedarf eine direkte mail an mich.

I have a scanned copy of the manual (25Megs) and the calibration-soft(2.6Megs)
When there is a need, please email me directly.

best regards

odo -from germany

The hottest thing is
Patrick Masotta's Backup Program
http://members.tripod.com/~pcr1000/index.html
This program allows you to open up all the blocked cellular bands using the
software and without having to do any physical modification to the radio.
Rumor is that this software may result in the pcr1000 having to be withdrwn
from the US market or heavily redesigned.

Friend of mine operates a tractor trailer, (18 wheeler) cross country. The Caterpiller engine is controlled by an inboard computer which interferes with his HF rig, but not VHF. The interference is severe enough to discourage operating HF.

Any suggestions on how to eliminate or substantially reduce the noise generated from the computer and received on his HF rig? Appreciate any assistance. Thanks. 73 K3BEQ

PS This is not ignition noise but computer generated whines and spikes etc.

4641. New Multicast HF digital mode

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-01 00:00:00 UTC

HF Multicast - Super Fast!
by Charles Brabham N5PVL

The @WW Problem:

The Ham digital HF forwarding network utilizes point-to-point links which are excellent for routing messages and bulletins to specific areas and locations.

Bulletins distributed @WW though, have no need for routing or delivery to a specific location since @WW bulletins go everywhere. In fact, trying to route these "everywhere" bulletins seriously degrades the HF forwarding net's ability to move the point-to-point and regional traffic it is designed to handle best.

This, in turn, throws a bad light upon the HF forwarding net which is both undeserved and unnecessary. It cannot do it's job very well because it is stuck trying to do a another, bigger job it is not really suited for.

The Multicast Solution:

Bulletins addressed @WW are perfectly suited to a message distribution (forwarding) system that has already seen widespread use by AMSAT BBS's, and some experimental terrestrial use on VHF/UHF freqs.

Multicast stations broadcast information of interest to amateurs, in the same way that EMWIN digital weather data is broadcast by the NWS on VHF. In this case though, the information being broadcast are @WW packet bulletins on the HF bands, for global (@WW) reception and distribution.

Since receiving stations do not need to be connected in order to pick up Multicast bulletins, any number of receiving stations located within the transmitter's coverage area can pick up those bulletins at the same time. Instead of a single point-to-point connection (one recipient per transmitter) there is multiple parallel routing. (multiple recipients)

Multicasting on HF makes a lot of sense. Since many stations simultaneously receive bulletins from one Multicast transmitter, the rate of data transfer over large geographical areas goes up much higher than we could ever hope to achieve by compression schemes or higher baud rates in conjunction with conventional point-to-point forwarding technique.

The packet network has a long history of difficulty with distributing data quickly over large areas. Point-to-Point networks are not well suited for that sort of distribution, by their nature. Multicast specifically addresses that problem, providing a solution which employs amateur radio and can be done now with simple, inexpensive equipment.

Since anybody on the planet with a computer, a TNC and an HF receiver could pick up and decode HF Multicasts, we can expect Multicast to cause packet radio nets to spring up in many new places. The problem in remote areas is not the small amount of traffic they send out @WW, but rather the large volume of traffic which must be received.

Hams at sea, hams on DXpiditions in remote areas, and hams who do not have good network connections will love HF Multicast as it will keep them abreast of events and provide a steady source of fresh data including propagation, keps, news, FAQs, and so on. Hams living in remote places where money and equipment are at a premium and a lot must be done with almost nothing will benefit the very most.

We are all familiar with the common problem experienced by SYSOPs of remotely located HF Packet BBS's, who can handle personal and limited bulletin traffic over their HF links just fine, but have no hope of receiving all of the @WW traffic with a traditional point-to-point link on crowded (useful) HF freqs. This common problem is specifically addressed by HF Multicast.

Once established, HF Multicast can be expected to reduce network loading throughout the ham radio digital network - HF and VHF/UHF. Just about everything should speed up a bit, due to reduced loading.

We can expect most packet BBS's to have one or more TNC/receiver combos going for Multicasts, because it will give so much "bang for the buck", relieving many VHF/UHF networks of forwarding the @WW load.

Participating in this kind of HF forwarding network will be easy and inexpensive enough for widespread participation to be possible - and likely. Recipients need only have a computer and an HF receiver capable of picking up SSB transmissions.

The more the merrier, with HF Multicast! Each additional recipient enhances the Multicast network's overall efficiency and speed instead of detracting from it, as is the case with Point-to-Point networks when more than three or four stations try to utilize a particular frequency at once.

An update system (using the point-to-point HF net) can be put in place for stations who miss a particular bulletin due to propagation, QRM, ect.. In all likelihood though, there would be no need to ask the Multicast server itself for an update when one of your closer neighbors can provide it for you, or you can catch that same bulletin again at another time or frequency.

Benefits to be Gained by Monitoring Multicasts
on Two or More Bands/Freqs Simultaneously.

You can reduce or eliminate the need to make update requests.

If the multicasts you monitor are not synchronized, an additional speed advantage is gained since you receive two bulletins (or more) at one time.

You are less affected by varying propagation conditions, band congestion, and so on.

For all it's efficiency in handling @WW bulletins, HF Multicast is poorly suited to point-to-point messaging and for the distribution of bulletins to a limited area. For this reason, HF Multicast would tend to ENHANCE the existing forwarding networks on HF, VHF/UHF, not replace or displace them. Different forwarding systems for different jobs.

Ham-Web Packet Radio Multicast Software by John Hansen, WA0PTV -

http://www.tapr.org/~wa0ptv

Ham-Web is currently the only terrestrial multicast software available to amateurs. It is intended for use at 1.2kb (and faster) for VHF/UHF, but may be operated on 10 meters at 1.2kb, and slowed down to 300bd for the low bands. Both Server and Client software are included in this package. Ham-Web runs under Win95, using a KISS TNC.
(TNC2, KPC-3, KPC-9612, PK-232, PK-88)

Note: Server's transmitter must be rated for continuous duty.

Current HF Multicast Activity:

The first Amateur HF Multicast transmission occurred at 9:30PM CST, 10-29-98 on 28.120 MHZ. I ran 25 watts power, and during this test 75,722 bytes of data were sent in 5 min, 27 seconds. The data was @WW bulletins, along with a text file containing information about the station.

@ 28.120 MHZ, LSB 1.2KB Multicast protocol.

I will be making more transmissions on or about that same frequency as time allows. I am running the server in "attended mode", which means that I only run it when I'm home. Unfortunately my XYL is currently laid up in the local hospital (She'll be OK!) so I am not at home to attend the server except for a few hours a day. This situation should improve in a few days.

Listen for long packets (6-7 seconds) separated by a few seconds or so. The "pause interval" varies a bit, but the packet frames always appear to be the same length.

If you are interested in running an HF Multicast server @WW, contact me and I'll be glad to share my setup info.

Please send comments, suggestions to:

4643. Re: New Multicast HF digital mode

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-01 00:00:00 UTC
From: Steve Sampson <ssampson@access.usa-site.net>
Message-ID: <IT%_1.284$85.3501787@news.goodnet.com>
Source record: 21589

The only problem I see here, is that the author has abandoned the project.
He doesn't even have the same Ham call. Never answers his email.

The software is deficient, in that it is required to running on a single
machine.
It is a network hog when attempts are made to network the files, and basically
is a demo.

It has no provisions for priority messages.

But given those reservations, it does demo a procedure that works for the
Weather service, and should work for Hams. I think if Hams put these up
instead of the current BBS, that it would improve things 100 percent. Then
have another port for receiving messages via packet/tor, or internet, with a
priority flag.

The best way to handle WW messages is to delete them. If the sysops
would just refuse to carry them, the packet BBS wouldn't need multicast.

Steve

Hi People
On the links sub page of the radio section of my homepage
is a direct link to a great freeware program. It will grab most of
the Trojans and retros that have been appearing during the last 6
months. It will NOT put a new TSR on your system so it will not
conflict with the big commercial AV's already on your system. I like
to run at least two AV's on my system - what one doesn't catch the
other most likely will. The trick is not to have them conflict which
they often will if BOTH are running TSR's.
By the way, if you haven't seen the new Mosley mini
tribander you can check it out on the Mosley page. It is really
tiny!! Very convenient for a temp QTH.

No doubt about it... The Ham-Web software is far from optimal, but then again I don't think it was intended to be. As you say, it's just a demo. - As is my present setup on 10 meters.

I could have slowed the thing down to 300 bd for the low bands, but felt like the long paclen would be too much of a problem there. It might just work well enough to demo on 10m, at 1.2kb. That remains to be seen.

I haven't heard any sig reports yet, so it's hard to say. I've ended up running 20 watts power, in order to avoid frying my finals. It's not continuous duty, but it's very close to it.

One nice thing is that it runs in the background just fine. The Ham-Web server is operating on the same machine as this E-mail program, right now. Both are doing just great.

A lot of the @WW stuff is garbage, but so is a lot of the stuff here. It seems to be par for the course.

they could beep faster or
remember more electrical
formulae
than someone else. I got my
Extra in 1963, well before
disincentive licensing, and it
was simply just another
personal
accomplishment, and did not
"elevate" me above other hams.
We
all shared the same spectrum,
worked together to solve the
same
problems, competed in
contests, trouble-shot each
others radios,
and generally had fun
together. If you forgot the
numbers for
the dipole formula, it was OK
to ask someone else. If your
Morse speed was 10WPM the
speedier guys would slow down
for you,

not QSY to some specially
reserved band segment. The
one or two
"old timers" on 75 meters who
didn't like newcomers ("No
lids, no
kids, not space cadets") were
universally looked down on as
poor
examples of what a ham ought
to act like. The Novice bands
were
a "cacaphony of exhuberance"
to steal a term that K1ZZ used
in
a meeting yesterday here in
Minneapolis. Old hands were on
those
Novice bands also -- it was
not unusual to hear W4KFC or
W5ZD
patiently working WN4KKN or
WV2CNL -- nobody remarked that
it
was "nice" of them to do
that -- it was just part of
being a
good ham. The notion that you
had "earned" your license
never
occured to anyone -- we were
just excitedly "playing in the
ether", and there was no
distinction on the air between
Extra,
Advanced, General, or
Conditional -- elitist special
callsign
formats to celebrate the fine
granulations of your testing
skills
had not been invented.

Today we are sliced and diced
into 6 different classes,
carefully
divided into our own special
frequency segments, and Lord
protect
the Extra who suggests that a

new Technician, who didn't pass his exam in front of a bored and stern FCC clerk, might have something to contribute to our beloved Amateur Radio service.

I respectfully propose that all current six license classes be scrapped and replaced by two new classes "Beginner", and "Helper of Beginners".

Rose colored glasses? I remember a net called Westcars (West coast amateur radio service) that operated in CA in the early 60's. It was on the same 40 meter freq day in day out and arranged mobile and phone patch traffic. The malicious interference and bickering that went on rivals what you hear today.

Why would anyone download a piece of unknown virus software from an unknown
sight and installit on a system? Looks to me like an excellent way to
PROPAGATE a virus.

Knowing how the FCC works, your statement is kind of humorous.

The FCC endorses the ARRL proposals. The ARRL showed them
that incentive licensing was the way to go, and the FCC rubber stamped
it. The same with the Spread Spectrum rules. The ARRL wrote them,
the FCC rubber stamped them, it is now law.

The ARRL is writing new rules for 5 wpm General (seeing how they are
dying off faster than people are upgrading) and the FCC will rubber stamp
that as well. The ARS is not that important a service for the FCC to
staff and spend real money on.

If Joe Blow petitions the FCC, his proposal is stamped "premature." If the
ARRL send in the same proposal, it is made the law. It's not that the ARRL
is any better/smarter than Joe Blow, it's just a way of doing business
cheaply.

To say otherwise is just ignoring the facts.

If you think that's bad, try my TRS-80, Model 1, Level 2 with a
homebuilt
300 baud modem. Actually, I don't use it anymore. Just hate to throw
something out that gave so many hours of fascination so long ago. Or
should
I have said "frustration ?".

Re: What ham radio is today. It is exactly just what YOU make it.
I have been an active ham since 1964. Still active and enjoying it.

I have upgraded mine with the DSP board, it also gives you V7.2
firmware at the same time. I notice a marked improvement in signal
capture, especially RTTY (which I use most, so I imagine I would
notice it most - hi,hi). I would say it is better than the DSP 59+ I'm
also using because I don't have to set it up, it just works.

Installation is easy if you can solder.

You weren't listening, Steve, so I'll say it again:

Just a reminder - in 1959, the FCC published a Notice of Inquiry asking what incentives could be tacked on to the Extra Class license. They received thousands of comments. We periodically read of folks criticizing the ARRL for "...hurting amateur radio with their incentive scheme..." but it was really the FCC itself that planted the idea in the first place.

Hi Ed,

For packet I use WinPack http://freespace.virgin.net/nigel.dyche/
Roger Barker Has an upgrade that will allow me to use Netscape on my
packet TNC connections. I haven't realy tried it it because the idea
dosn't really turn me on, I have heard that Internet Explorer will work
as well. Have fun...

Incentive licensing is what almost shut the ARRL down. It was one of
the most stupid things ever promoted by the ARRL. I am not a memeber
nor will ever be..

Steve W4LW yes, I am extra class WITHOUT any ARRL help!!!

I don't know who or what you are, but a historian you are NOT. The FCC--you know, that entity that regulates the electromagnetic spectrum in the USA- first proposed Incentive Licensing in 1959-about the time you were eleven years old. The ARRL entered the scene as it always has--as the advocate for hams, and most of the details of the plan that was adopted came from the FCC, *NOT* the ARRL. In fact, ARRL persuaded FCC to drop succeding phases which would have caused even more pain to some hams. But it gives you a good excuse to inaccurately bash the League, and complain, to say nothing about braying your license class about. If you held a pre-Incentive extra, and that seems unlikely, you had one of some 4,000 then issued. Most were held by commercial CW operators, and there was no real reason for mainstream hams to concern themselves, after all there was NOTHING to be gained except the "prestige". And for most people "bragging rights" are worth what they apppear to be worth--not much.

So stay away from the ARRL-- they'll continue to work for the best interests of all hams anyway, you included--if they can figure out what those interests are, given all the garbage being spread these days.

<mikeberg@midstate.tds.net> writes
>Can someone tell me how the checksum in a NMEA sentence, RMC for
>example, is calculated?

Mike:

From http://www.garmin.com/faqs:

The checksum is the 8-bit exclusive OR (no start or stop bits) of all
characters in the sentence, including the "," delimiters,
between -- but not including -- the "$" and "*" delimiters.

The hexadecimal value of the most significant and least significant 4
bits of the result are converted to two ASCII characters (0-9,
A-F) for transmission. The most significant character is transmitted
first.

I personally like and use the 1000i card. It would have to be the best value for money scanner available, particularly when you take into account all the things that it can do.

I'd say go for it. But thats my opinion!

Cheers
Wayne

It sounds like you've got the same problem as I have. My 1270 will not key up the rig either. The PTT diode on the front panel lights up, but there's no PTT. Have tried several hookup cables and radios, always with the same results.

Where's the MFJ gurus ?

I just d/l'ed K6STI's RITTY2.35 software and have not been able to get
it to work.

Seems that all I can get is a title screen after clicking on the
instructed ICON. I break out of the title screen using
Ctrl-Alt-Delete.
The instruction book talks about typing in RITTY to start the program.

I am running WIN95 OSR2. I am not experienced in running DOS programs
under Windows.
Im at a loss here !

Please email any suggestions to: wa2rsx@att.net
and post to this group.

Thanks es 73s es Gud RTTYing,

Vince

Time to drag out the old volt meter! Do you get a ground on the PTT lead on the connector with the tnc asserting PTT? The 1270 uses a VK10 (as I remember) as the PTT - maybe yours went poof? Do you have radio chassis ground attached to tnc chassis ground? Do you have a voltage bias on the radio ptt lead? Can you key the radio with a alligator clip lead? Is the pin on the radio that you think is ground - REALLY ground?

Message-ID: <19981103162258859 11@scotia-technologies.co.uk>
Source record: 21632

Looking for the above interface to work at upto 9600 bps, though would normally work at 4800.

I am willing to build a unit myself if there is none ready built at a reasonable price, just point me to a schematic.

It's for widebandwidth (40Khz) telemetry work.

Sorry, maybe not strictly HAM, but this is the closest NG I could find.

Rather than bashing the ARRL, why not join it and try to change it through proactive participation? As for the FCC, we're talking government bureacracy-- maybe we should work to get hams elected to congress. Any takers?

I don't understand what all the fuss is about. I found the link in less
than 1 1/2 minutes. It wasn't that clear, but it wasn't that difficult
either. We aren't being charged to peruse this site, it is a little too
graphic intensive for my tastes, but no one is forcing me to stay at the
site any longer than I choose, and I wouldn't presume to force my taste,
or lack of it, on others. Having done a little HTML work, it's obvious
to me that a lot of effort was put into this site. I might even be a
little jealous, as I have little or no artistic skills.

I would be inclined to cut the site author a little slack, hey it even
has a section on Ham Radio.

Bonjour cher om
Le probleme de votre 940 est bien connu !!
Lorsque vous avez ce genre de probleme cela veut dire que votre PLL n'est
pas verouille donc il est incapable de se caler en reception et en emission.
Ne vous inquiete pas votre 940 n'est pas mort hi!!!
il suffit simplement de refaire toutes les soudures sur la platine PLL unit
qui se trouve de memoire presque au dessus du hp.Mais vous auriez tant qu'a
faire refaire egalement les autres soudures des platines car malheureusement
cela est son seul defaut

Baycom has several 9600 bps models, see http://www.baycom.de for details.
These use a parallel, rather than a serial port.

4692. RTTY Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-03 00:00:00 UTC
From: Jeff Francis <jfrancis@io.frii.com>
Message-ID: <71nnkcjip1@europa.frii.com>
Source record: 21688

I have an RTTY question. I just bought a new SCS PTC-II, and got it all wired up to the radio. Works fine receiving AMTOR, PACTOR, PACTOR II, and packet, but for the life of me, I can't get it to receive RTTY. I've tried tweaking and tuning every parameter I can think of (including setting the radio to LSB, USB, and RTTY), but all I get is a stream of gibberish. My guess is that either I have the baud rate wrong, or every person on earth using RTTY is in a drunken stupor and can't type worth a darn. ;^) I suspect it's the baud rate. I had assumed that RTTY always ran at 45 baud (probably a bad assumption). I've tried a number of different rates, but I don't have the patience to try everything from 30 to 300 baud one at a time. Any suggestions on what to try?

Thanks!

Nothing personal, mind you...but I would NEVER retrieve a "sensitive" file such as you're touting (an anti-virus program) from anyone other than the author or author's designee.

And this is about the ONLY time you'll ever see me use "absolutes" online.

The major anti-virus utilities all have their own official Web sites, and that's where I would go on my own to grab the latest and greatest.

Again - nothing personal. But I haven't run into ANY virus problems in over twenty years' worth of downloads, so I can't be too far off-base with my methods.

I agree with you. This is exactly where the AV program comes from.
It is not resident on my personal site. My site has only a link to
the authors. They have an international reputation and are
considered by many to be the best. If you had followed the link you
would have seen this to be the case.

Well, I spent some time and looked thru the site. I found no link to
virus software. I found no ... repeat no information content. All I got
was some shit that danced around on the screen. Sorry for the profanity,
but the site is not ready for anyone to view.

Jeff:

In the USA, the standard RTTY parameters are:

LSB
170Hertz shift, 2210Hertz center frequency
45Baud

I suggest that u set ur radio to LSB receive position as a starting point. U might need to use the I.F. shift on ur radio if using a LSB position and a narrow filter selection (i.e., 500Hz or 250Hz)..

Perhaps if you post what radio u are using, others might be able to offer more suggestions. Some radios use marking of FSK or RTTY or LSB.

Good luck and have fun.

45 baud is correct for ham radio RTTY. I suspect you have the mark
and space reversed. I'm not familiar with that equipment so I can't
tell you how to change it, but there has to be a way.

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

The problem is that it rewards effort and achievement, and that concept is elitist, divisive and discriminatory and it has destroyed amateur radio. The plain fact that the HF bands in general, and the higher class allocations in particular, are now deserted and in imminent danger of being lost because of disuse, is all the proof anyone could need of how badly this system has worked. No matter which way I beam my Bird Termaline antenna I just never hear anyone on any more. I thought that maybe I had used too much DX grease on it because, although the SWR is brilliant, there is now a large stain on my desk. But that's dumb, you can never use too much DX grease.

4705. HELP: Computer/TNC HF Interference

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-04 00:00:00 UTC
From: David Rodman <rodman@acsu.buffalo.edu>
Message-ID: <Pine.GSO.3.96.981104064018.10506B-100000@xena.acsu.buffalo.edu>
Source record: 21701

I have two computers near my HF station as well as multiple PacComm Tiny 2 TNCs for my PacketCluster node.

The 386 computer running the PacketCluster node is RF quiet, but the TNCs generate considerable amounts of chirps and continuous RF noise (especially on 15 and 10 meter HF bands). The chirping almost totally disappears when the computer connection cables are disconnected from the TNC. I have some toroidal cores on the lines. They help, but do not quiet the signals to less than S-9 on 15 m (SSB mode).

My main computer, used by the family and me for logging, RTTY, Pactor, etc. generates a strong hissing RF signal that is receivable at my two transceivers with just a piece of clip lead on the SO239 antenna input. It is loudest on 40 m and heard on all bands, except 160 m. It appears when the computer comes on, disappears when it turns off. It continues when the hard drive is off in the sleep mode. This computer is a Pentium 200 MMX, 24X CD-ROM, 48 MB ram, modem, etc. Pretty standard stuff. Disconnecting all leads from it makes no difference. When a separate RF ground is placed on the cabinet of the computer, the noise becomes 1 S unit less, but is still very strong (CW mode).

Any comments on these two problems and suggestions for solutions will be greatly appreciated. The station is pretty much unusable right now.

I have one and it performs very well, especially as a VHF/UHF scanner.
I used it for ACARS and WEfax (using the Winradio Digital Suite) but
have no POCSAG experience.

By joining the ARRL, you can't change anything. You will get a magazine
subscription.

ARRL membership are sheep. Just look at those in Director positions.
They are all in-bred.

You won't change anything, and all the sheep vote for the incumbent 99%
of the time (or don't vote at all). 1 vote means squat in the big picture.

Wrong.

>You will get a magazine subscription.

Yes, that's one element of membership.

>ARRL membership are sheep. Just look at those in Director positions.
>They are all in-bred.

MOST volunteer organizations are the same when
it comes to getting VOLUNTEERS willing to put in
the time and effort needed for the position. I was national
president of a sports car club. I NEVER was opposed for
office AND my successor wasn't either.

>You won't change anything, and all the sheep vote for the incumbent 99%

That's the same bull that many people spout as to
why they don't vote in any election. The reality is that
every vote adds to the TOTAL and I've seen votes
as close as a handful that made the difference.

So I'll reiterate Marv, KC0EGB's post...

i agree 100%!! the mag sucks, arrl's response for the lousy mag is not a realistic one. i confronted evelyn gauzens with this same argument and the excuse was that that mag is part of the membership but not the basis. i asked arrl to give me qrx (aprox 8 pages) and keep their qst, they declined. they state that the mag must represent all hams (all hams must be into HF only). when questioned about the arrl's constant ramming of cw down everybodies throats she said it was what the membership choose. nobody wants our hf bands, everybody and their brother wants our vhf and up. it doesnt make sense..... maybe they're getting a kick back from large industry to look away...i dont know...

anybody want to start a new radio league that listens to the people it represents? i'm game! we need to get with the times. some of us just plain dont care to learn cw or work hf. what is so wrong with that? we should stop dwelling on trying to make everybody learn cw and follow the lead the europeans have established. their mentallity is we are all radio hobbyist, we all have diverse interest, we all can get along without putting each other down. even the cb'rs hang with the hams over there. whats the problem folk? all we're doing is hurting ourselves by putting each other down.

Because the incentive is only in the testing phase. A.T or after test, all hams pretty much are the same. IE: I feel exactly the same as an extra as I did as a general. I don't know any more as an extra than I did as a general except for the data I've consumed since upgrading. And I would have still consumed the same data as a general. I've been able to see no indication that incentive licensing has helped make more competant op's. All incentive licensing does is cut up the ham bands into silly little pieces. The general class bands stay packed, and the higher class bands generally stay pretty unused. So you have a lopsided and fairly stupid way of using spectrum space. I'm an extra here, but almost NEVER use my allocated extra band space. I hang out in the general bands with the people I've talked to for years. I bet plenty of other extras do the same. So what you end up with is 85% of the people crammed into the general bands and the advanced bands get a slimmer use, and the extra bands a dead zone nearly except for the cw bands. Overall a silly way to use the spectrum. They should just open the bands up wide open and let people go where they want. Would be a more even use of the bands and ease the incentive bottlenecking. MK

Since incentive license started,amateur radio has been divided into groups or classes. The beginning of the decaying process which is evident today. Where is the incentive today when Technician Class will automatically be General Class . If your an ARRL member and disagree with what they are doing, Discontinue your subscription and membership and see how fast things turn around....

It certainly does reward effort and achievement! And because our
society is plagued with creeping socialism, we see more and more
criticism of individual efforts. Honest effort usually leads to
success. Success provides a sharp contrast and visibility
between effort and the lack thereof.

The divisiveness of achievement is generated by the envy of the
under achievers!

Discriminatory? Only in the minds of the under achievers.
Claiming discrimination is a self serving way of excusing and
covering an absence of effort. This is particularly so when the
same requirement set is applied equally to all.

Jeff:

You should also be aware that many commercial stations are sending data streams that will be meaningless to you, and some are encoding/scrambling their transmissions. So you may see a lot of gibberish in those bands.

For Ham transmission, however, most follow the standards Bill and others have described, and you should be able to receive intelligence easily (from some Hams, anyway ;-).

Clint Think about what you are saying. You have free will - nobody
is making you do anything. Almost every ham page I have ever seen
has direct links to other pages. It is far easier to simply click on
a link of interest and quickly go where you want to. This is done
for the convenience of the page visitor and for no other reason. As
a matter of fact, that is the fundamental premise of the WWW. Links.
Like you said....Oh, well!

Dean, you clearly suffer from a total irony failure. How any active
licensed ham could eat that bit about there being empty HF bands
simply beggars belief.

I vote in the primary. I vote to get rid of the weasels.

I never vote in a general election. After the primary, I don't
really care who wins. If your candidate loses the primary,
it really doesn't matter who wins. Jack-Ass or GOP, they both
are part of the 5 Trillion dollar problem.

In Oregon, you don't have to vote anyway, as the candidates
are already elected before the polls open.

Not to mention the part about their Bird Termaline antenna. Last time
I looked, a Termaline was designed as a dummy load, and really wouldn't
be expected to radiate well at all. (But the SWR should be excellent!).

I expect the original author intended it as a satire on the "more worthy"
hams who have passed a high-speed code test but are a little short on
technical knowledge.

Dave

I wouldn't assume you have any priorities at all, and apparently you don't. If you want an education, go to college. Carping about a system that puts reasonable limits on the number of users without resorting to the numerical quotas and cash auctions that the FCC uses for other services, is a waste of time.

And for the record, demonstrating the operating skills to get 5BDXCC IS a meaningful accomplishment. More meaningful than demonstrating "keyboard diarrhea" on an NG!

How else can you have multiple license classes without some incentive
to upgrade?

I don't know about your QTH, but here in VK3 (Victoria, Australia),
on 2m at least, license class seems to make no difference whatsoever,
which seems right to me.

I made no statement about whether I liked it or not. As a matter

of fact, I was a General when the change occurred and I did not like it. Took me six months and two attempts to do, but I went right back to where I was operating before the change.

There is nothing "fair" about life. Play by the rules in place. If you don't like the rules, then work within the system to change them. Start an effort to implement the plan you propose. It will give me all kinds trouble and headaches. But you can be sure of one thing...I will face squarely ever challenge you put up;
and I will meet it! Thats how much I care about operating on ham radio.

Our opinion differences can be summed up nicely. Something happened to me that I did not like; but I got over it!

4741. Do I Need 2 TNC cables for ICOM-746?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-05 00:00:00 UTC
From: n2rud@my-dejanews.com
Message-ID: <71sv87$4tf$1@nnrp1.dejanews.com>
Source record: 21648

Greetings,

I would like to try both 2M packet and digital HF work (RTTY) using an ICOM-746 HF/6/2M base station transceiver and an MFJ 1278-B all-mode TNC. I see that the ICOM has two 8-pin ACC jacks in the back for this purpose. Do I need to run two cables to the TNC, one for 2M packet and the other for HF-RTTY, to make this work? Help! This is all new to me. I've only run a little packet using a 2M mobile rig before this, with a lot of help from another ham. I'm all set to order MFJ cables, two if needed, but I'm not sure if I need two cables and don't know which cables to order.

The last time I tried packet, I bought a custom-made TNC cable from Universal Radio, but they no will no longer make custom cables - darn it! Does anyone know if there are other companies, besides MFJ, that make TNC cables? If so, please let me know. The cables from Universal Radio were very well made, much better than the one cable I bought from MFJ back then. In fact, the MFJ cable broke off at the connector the same day it arrived! The Universal Radio cables were much heavier and well-sealed at both ends - very nicely built.

The Icom-746 manual page on describing the use of the two ACC connections, pin-outs and all, shows ACC-1 as a round 8-pin connection, possibly better for AFSK-RTTY and HF digital, only because the word "RTTY" used to describe the function of pin number one there.

The ACC-2 connection is a round 7-pin connection, perhaps is better suited to 2m packet. I see the words "144 MHz only" in the description for pin number 6 on this connection, so I guess this one is for packet.

I'm just guessing here, and have no idea what I'm doing with this. The manual does not clearly label either ACC connection as being used with HF or packet, but I am trying to deduce this from the pin-out chart on the page. The text seems to speak in generalities, assuming the user knows what to do. The manual refers to TNCs this way:

"When using such units be sure to consult the appropriate manual."

Well gee, ain't that just a big, fine, whopping bowl of help? Thanks Icom!

Hope someone here can help me with this. Do I get an 8-pin MFJ connecting cable for using HF digitil modes on the ACC-1 connection, and a 7-pin connecting cable for using the 2m packet mode on the ACC-2 connection?

Thanks for listening. I only hope MFJ knows how to make the cables!

Hello Dean OM,

I concur completely (what prudent person would not?).

When someone signs a letter "Me", that tells it all.

Effort and achievement lead to obvious differences, made very visible
to those who are unwilling to exert effort themselves. There is nothing
wrong with the word 'elite'. It is something to shoot for yourself!
This is the way it should always be, of course. Rewards always
rightfully belong to those who achieve, not those who don't. This
is stuff one learns when a small child, and is idiotic to question
as an adult, egad! Someone needs to Grow Up, it seems.

What scares me is were in the hands of ARRL who depends on the Ham Radio population to support itself. They will do what is best for them and not Ham Radio.

Why is this being posted to so many news groups? I've seen nothing in this thread dealing with antennas, boatanchors, digital communications, equipment, homebrewing, or space communications. The only thing related to DX are slams against those who call CQ DX or chase paper. Are you seriously interested in exchanging ideas or just trolling?

There's nothing wrong with an incentive licensing scheme that rewards technical merit. There is much wrong with an incentive licensing scheme that rewards the ability to chirp like an insect at the expense of technical merit. The sooner the ARS starts rewarding technical merit, the sooner ham radio will recover from the present unfortunate anti-technology attitudes.

Source record: 21658

Hi Lou,

In PacTerm '98 to call CQ, Click on the Pactor button on the toolbar. This will set Pactor mode, then click on the T button on the toolbar, this will turn the transmitter on.

Once that is done, in the chat buffer, type your CQ message (or you can do an automated CQ by using one of the HF macros).

Once that is done, click on the 'R' button on the toolbar. If someone wants to link with you, then they'll do so in that mode.

Keep in mind once connected, you'll need to use the IRS/ISS buttons to change from transmitting station to receive station.

For long path, in the link box, put an '!' in front of the callsign.

If you don't have it, and need it, the PacTerm '98 manual is on the web site, at http://www.cssincorp.com/pacterm. You can download it and print it out with WordPad. A good overview of Pactor, Amtor and other HF modes are there. (As well as in the Kam manual and the ARRL books).

> 73, Cecil, W6RCA

Too late. The majority of hams now are non-technical types. Aside from small weekend projects most don't build equipment. Most can't work on the microscopic computer boards in modern radios, and have to send them in to be fixed like a broken TV. The tide has been turning for years and there is little hope of reversing it. Ham radio is fast becoming a communicators hobby.

I am looking for any comments, information, ready made cables, or upgrades to interface an MFJ 1278 to a Ten Tec Argosy II for both cw and data modes. Also looking to interface it to an Alinco DJ1FT. I am also looking for cables to connect it to an Uniden Hr2510 for cw and data.

Does anybody have a copy of the MFJ windows software for this multimode?

Has anybody used this controller with Win/CE based handheld? Where can I get a cheap handheld (dos or win, It just needs a seriel port and/or a terminal program).

Hi,
what are the differences or improvements if I convert to DSP?

How about put your antenna far away from your computer ?

I used to live in a house that has two floors, my rig and
computer on 2nd floor, the antenna on the roof, computer
make "big" interference to my rig(HF bands).

While I move to a house on 3rd floor, and put antenna on
roof(this apartment has 5 floors), same equipments--- rig
and computer, but got no interference from computer, work
fine with all digital QSO--- SSTV, RTTY....

Desktop PCs/monitors do not have to pass emissions testing as a "system",
only as a box. Laptops have to pass emissions testing as a system.
So I do not use a desktop with my transceiver. I use a laptop for ham
radio applications. My desktop monitor is my big problem with RFI.

There's been "chirping like insects" for as long as there has been the ARS... suddenly now it is responsible for all of the service's problems?

Personally, I think part of the problem is that homebrewing is dead. It's hard to build a serious rig when every component in it is micron sized and microprocessor based. Part of the allure for me as a ham in the 60s was building my own gear. That was an incentive for figuring out how things worked.

It's also hard to work on modern rigs, and generally the fix is to find out which black box in the set needs replacing and replace it. Big fun.

I had the same problem with the demo. The software is not seeing the
sound card. Check to see if you have conflicting addresses. Usually
A220. I had another card using that address. I removed the card, and
every thing worked. Suggest you use the "Diagnose" application that
comes with the SB16 card do find the problem.
By the way. If your only interested in RTTY as I am, I found "Blaster
TeLetype" a good program to use after playing with RITTY.

Actually millions of years longer than that. :-)

> Personally, I think part of the problem is that homebrewing is dead.
> It's hard to build a serious rig when every component in it is micron
> sized and microprocessor based.

Actually homebrewing is easier now than then. Integrated circuits
have taken much of the toil out of homebrewing and microprocessors
are easier to program than electronic circuits were to design and
build. Digital radios are just down the road. Digital is easy.
If it's not a 'one' or 'zero', it's broke.

> Part of the allure for me as a ham in
> the 60s was building my own gear. That was an incentive for figuring

Get after it. Change with the times. It's easy. I do it all the time.
I just bought a DSP evaluation board.

> It's also hard to work on modern rigs, and generally the fix is to find
> out which black box in the set needs replacing and replace it. Big fun.

So it's a challenge. Get after it. If it's worth repairing, I fix all
my own electronics stuff. The only time I ever sent anything back for
repair was when my IC-745 lost its program memory which was in RAM.

>Just remember that eventually the tide turns the other way.

Real tides are periodic, and always turn the other way.

"The tide turns" as a metaphor for changes over time often does
not change direction. When the tide turns in a military battle,
the side that just went from winning to losing often goes to
eventual defeat.

It seems to me that there are two problems with retaining the
experimental side of the hobby: One is that commercial gear is
so much more sophisticated than it used to be that it's essentially
impossible to built competitive equipment at home. Thus, experimentation
is now something people do because they like experimenting, or because
they want to explore a mode or a technique not available in commercial
radios. People no longer build radios just to use them to communicate -
they buy a radio instead. So the set of experimenters is much smaller.

The other problem is that the rules seem to be set up to discourage
experimentation. Imagine if 1/3 of the bandwidth of every ham bad
was set aside for "non-traditional" modulation schemes. CW, AM and
SSB voice, and FM voice could be forbidden, along with any data
transmission using standard 1200 and 9600 bps modulation. There
would be an additional incentive to try something new - that's the
sort of incentive that would make a useful contribution to the hobby.

We can't build 'cuz it's too hard. Whine, Whine, Whine. Woe is
us. Actually, building and experimenting is easier than it
ever has been because the tools are so much better than they were
in the past. A PC can do for us in seconds what took many hours of
manual/mental/trial&error effort in the past.

What keeps people from simply duplicating designs from 40 years ago?
All the parts are still available.

> The other problem is that the rules seem to be set up to discourage
> experimentation.

Yes they are. The Morse code requirement is a good example. The time
spent learning Morse code would be much better spent learning
electronic theory and how to experiment. As a Return On Investment,
for the average ham, the Morse code requirement has proven to be next
to worthless for the past 30 years. If I had a stock which promised
salvation during emergencies and didn't deliver, I'd sell it, give
it away, or burn it.

Hello Jim:

Yep, at present, my interest is with Baudot RTTY and CW modes. SSTV takes video capture devices and artistic talent, both- I dont have !

My sound card is not the standard SB. It is an Ensonique PCI Audio card in a Quantex Microsystems Pentium2/233.

Thanks for your info. I recently d/l'ed BTL, but also could not get that one to work either. It reported compatible 3.1 sound card, however. Appears that I am not getting any audio into the sound card, as all I get is expanding/collapsing tuning indicator, and the level bar graph stays at a fixed amount of deflection.

I really would like to get hold of something that works under WIN95/Plug---n-Play. At present, I am using a RadShack Color computer and a homemade afsk hardware modem.

Tnx again. 73s es have fun on RTTY.

Marv OM,

We are living, now, in a Golden Age for ham radio homebrewing. Yes, that's right. I for have been building CW and FSK transmitters, receivers, and most recently a phasing type DC receiver, which works beautifully. Much easier than the Old Days, which I remember well (at least back to the early 50's). No chassis work, no high voltage, no metal work, etc. Integrated circuits take much of the drudgery and detail out of building rigs. The reason there is less homebrewing now is LACK OF INTEREST AND MOTIVATION, that's all. Most of the folks who claim you cannot build anything today are the ones who do not do it, so they know not whereof they speak at all. I have found parts to be plentiful and cheap. I am well into the bifocal age myself and find that I can handle SMT components fairly well. Just use good light and a magnifier if needed; it is done every day by those that you seldom hear from. We are currently in a resurgence of homebrewing activity.
Like every other activity in life, when it comes to ham radio, one is either technically interested, or not. One's daily activity reveals what their interests really are.

73,

Don, W6JL

Currently, the only real 32-bit-Win95-native app that does RTTY mod/demod through the soundcard is Writelog / RTTYRite - it's primarily a contest logging program but has a very good RTTY soundcard modem built in also. The ragchewing RTTY interface isn't that great, but it gets the job done. For RTTY contesting, it's unbeatable. Have a look at:
http://www.contesting.com/writelog

I suspect you'll have trouble getting the Ensoniq sound card to work - it's not a true SoundBlaster, which is pretty much required for BTL and RITTY (some "compatibles" will work if you get lucky). I had trouble with BTL until I got a true SoundBlaster card. After that, it worked great - still use it for RTTY rag chewing sometimes.

RITTY I think requires a true SoundBlaster; I'm not sure about BTL. But I'm reasonably sure that both of them use very low-level hardware instructions to get the mod/demod done - "compatible" soundcards may or may not support all of the instructions being used.

You can find real SoundBlaster cards for cheap - on the order of $20 or so - at any hamfest.

You might try booting to DOS (not a DOS command prompt under Win95) and see if it works any better - hit F8 when the reboot starts and pick "previous version of DOS" from the menu. Doing a "Restart in DOS Mode" from the Win95 shutdown screen *might* be good enough, but it's not the same thing as booting directly to DOS.

Hey, I'm one of the people who would rather build something than talk
to other people on the radio. But just how many hams have you met that
have the technical resources to build something on par with a current-
day commercial transceiver? Particularly on their own? Very few.
Could they do it for the same cost (assuming that their labour was free)?
Probably not.

>What keeps people from simply duplicating designs from 40 years ago?
>All the parts are still available.

But the designs from years ago are not competitive with current
designs, at least in operating and display features. So people who
just want to talk to other people, and are fundamentally uninterested
in building things, just buy something. 40 years ago, they might have
built instead, because building was cheaper or better.

>> The other problem is that the rules seem to be set up to discourage

Agreed. The other thing I had in mind when I wrote this was
how the old guard seemed intent on preventing the use of spread
spectrum if it might, just possibly, maybe, increase the noise floor
a little for their DX paper chasing. That's why I suggested setting
aside some bandwidth where traditional modes are banned and experimentation
is welcome. I can imagine the howl if it was ever formally proposed,
though.

It doesn't have to be on a par with an IC-775.

> But the designs from years ago are not competitive with current
> designs, at least in operating and display features.

The easiest part of the radio is the operating and display features.
It is is a digital microcontroller. It can be done from a PC
using the parallel port. A good starting exercise would be to put
a standard transceiver under PC control. My ICOMs have a serial
protocol built in for that purpose. A DSP eval board will do serious
filtering and the PC development software comes with the board. That's
an excellent way to get started experimenting. TAPR has SIGs dedicated
to such.

There's absolutely nothing to keep hams from experimenting except
the hams themselves.

The thing is, DSP programming and math *is* interesting to some
people. Much much more interesting than learning Morse code. These
are the people we should be encouraging to become new hams.

Forget about educating people who don't want to learn new stuff - it's
a lost cause. Let them have their current licence priviledges until
they die.

But for the future, we should be trying to attract people who like to
experiment, not chase them away. If it's necessary to us an "incentive"
of extra subbands to encourage something, use it to encourage technical
proficiency and experimentation, not near-dead communication modes.

The Netherlands, November 6, 1998.
Hello dear reader,

NET/Mac v2.3.67 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Made the 'rebootonbaddate' command more realistic

- Added support for ethernet
(see: the version.c file and the online HELP for the 'attach' command)

- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

The latest version of NET/Mac can be downloaded from my homepage:
http://www.caiw.nl/~adam

Kind regards,

> 73,
>
> Don, W6JL

Don is exactly right. There has never been a better time for the
homebrewer and experimenter. A large part of that is due to
SMT and VLSI. SMT allows us to fabricate complex circuit
boards without having to resort to drilling and plating through
holes. It is now faster, easier, and cheaper to lay out, etch,

and load a board than it ever was with leaded parts. We don't need special CNC drills or nasty plating baths.

The techniques for working with SMT and VLSI aren't complex, and don't require very expensive and exotic equipment. The equipment required is actually cheaper and simpler than for working with thru-hole parts, but some new skills do have to be learned. 80 year old watchmakers 350 years ago, and jewelers going back to pre-history, mastered these skills, however, so age and lack of exotic tools aren't barriers preventing the amateur from working at this level.

VLSI has encapsulated entire functional subsystems into a single component. That's made complex circuit functions easy to design and build. PALs, GALs, and programmable DSP parts have made realizing virtually any transfer function simple.

More and more our radios use digital signal processing techniques to realize their transfer functions. This trend will continue to accelerate. In broadcast, even that traditional analog stronghold, the PA, has given way to high efficiency digital switch mode design. It is only a matter of time before amateur equipment also exploits the advantages of DSP for virtually the entire radio from end to end.

Many of these functions can be designed and tested on the PC before solder is ever laid to copper. Anyone with a PC and a few design tools is as well equipped as any corporate drone for doing this work. Amateurs willing to acquire the knowledge and skills required are on an equal footing with the professionals. Cost, and the need for specialized equipment to develop new systems, has virtually disappeared as a separator between the amateur and the professional. Most circuits translate directly from screen to copper and work first time. A lot of tinkering and fussing with prototypes isn't required.

This latter seems to put off some amateurs. They've always developed circuits by trial and error, and that isn't as easy to do today as in the past. Some knowledge and skill at design is now required from the start of a project. The builder has to think and plan a bit more than in the past. But on the flip side, his project is more apt to work correctly the first time too.

The knowledge and skill required is not difficult to obtain. Claims that an EE degree is required are false. If you need information force fed to you in a structured setting, then it may indeed be true that you might have to enroll in an EE program. But amateurs shouldn't need to be force fed. Our curiosity should be sufficient spur. The knowledge required is available in books and on the web, all it takes is the interest and initiative to go seek it out. We don't have to be well rounded products of university, we can focus as narrowly on our own objectives as we like.

Since much of the functionality of a radio is now software, and since software is the ultimate cottage industry, amateurs have a greater opportunity than ever to play at the same level as the corporate

giants. And since amateurs have no deadlines or quarterly profits to concern them, they are free to pursue ideas that might seem too exotic or long term for the corporate environment. Amateurs have the greatest freedom of all, the freedom to fail. If our idea doesn't work, no bottom line is impacted. This means that we can poke into any dark corner (which is where all the fundamental breakthroughs hide) without worrying about keeping our jobs. We don't have to stick to only sure things where schedules and deadlines can be maintained. This is a huge advantage.

The days when we looked to the great corporate laboratories for innovation are gone, victims of quarterly bottom line pressure and corporate downsizing. Real innovation today comes from small aggressive groups equipped little differently from the amateur. We don't have to take a backseat to them, unless we lack the interest and enthusiasm to work at their level.

We don't have to be consumers of the products of Japanese industry unless we want to be. We can build equipment which is comparable to, or exceeds, the capabilities of the factory rigs right on our home workbenches. (Our radios might not be as pretty, lacking stamped or injection molded cases, but they can work just as well, or better, than the consumer appliances many of us buy.) It is really up to us, there are no real barriers preventing us from doing it except our own self-imposed limitations.

I'd say most hams have the resources, or can easily acquire them,
to build a radio which can exceed the performance of a current day
transceiver. Few have the gumption to try. Cost can be a bit less too,
but again you have to be willing to try. The one area where hams
probably can't duplicate commercial equipment is appearance.
Without access to stamping machines or injection molders, our
efforts look a bit "amateurish".

>>What keeps people from simply duplicating designs from 40 years ago?
>>All the parts are still available.

Parts aren't always available. Lots of the 40 year old designs
used parts that are no longer used in electronic production. You'd
have to do some serious scrounging to locate some of them. Of
course hams have always been scroungers, but building with this
generation's parts makes more sense.

>Too late. The majority of hams now are non-technical types.

Probably so ... at least as in "They're not technical professionals."
That doesn't mean that they can't/shouldn't learn about the technology
of electronics and radio communications. On the contrary ... one
of the main purposes of the existence of amateur radio is for self-training
and education in the technology.

> Aside from small weekend projects most don't build equipment.

That's sad, but true ... we should encourage more building ... but before
the procoders jump in with "That's why we must maintain Morse testing,
because it's so easy to build a CW rig ..." let me say "HORSEFEATHERS!"

It's no more difficult to build something FAR more effective and efficient
than an OOK Morse rig.

As has been outlined here MANY times, even simple BFSK has an
advantage of (at least) about 9 dB over OOK Morse ... the main gripe
of the procode faction is that it (usually) involves the use of a machine
(microcontroller) to perform the encoding/decoding function ... why they
must insist that manual methods must always be considered "superior"
is beyond many of us ... it flies in the face of the physical and technical
realities of the world we live in, but many insist on adherence to that dogma
with pseudo-religious fervor.

> Most can't work on the microscopic computer boards in modern radios,

Only because they have avoided accumulating the necessary basic
knowledge and simple tools necessary to do so. I routinely work with
moderately fine pitch ICs (SSOICs, TQFPs, etc.) and passives of 0603
size with simple tools and no problems.

>The tide has been turning for years and there is little hope of reversing it.

Why? Because you say so? When we place more value and emphasis on
technical abilities and knowledge than, as Cecil said, "chirping like insects,"

we'll see a turnaround.

> Ham radio is fast becoming a communicators hobby.

That is a course destined to self-imposed extinction ... there is no way
that we will be able to justify our allocations far into the future on the basis
of a communicator's hobby. The current demands for spectrum are too
great and they will only increase in coming years (yes, even into the HF
bands, I predict) ...

>There's been "chirping like insects" for as long as there has been the
>ARS... suddenly now it is responsible for all of the service's problems?

The problems are the result of the refusal of many to "keep up with
the times" and accept the need to adapt to changing technology.

>Personally, I think part of the problem is that homebrewing is dead.

I agree that there is not nearly enough building going on ...

>It's hard to build a serious rig when every component in it is micron
>sized and microprocessor based.

That's where you're mistaken ... all that's happened is that functions
that used to take entire racks of tubes have been integrated into
ICs ... it's actually MUCH easier to design/build a "serious rig" today
than it's ever been in the past ... IF you understand how the modern
technology works ... there's that "nasty" requirement for having some
technical knowledge/skills and keeping them up-to-date.

Of course you can't design/build a "serious rig" today if all you know
is tubes ... perhaps this does not apply to you, personally, but it
DOES apply to a LOT of old-timers.

> Part of the allure for me as a ham in
>the 60s was building my own gear. That was an incentive for figuring
>out how things worked.

So why did that incentive disappear? It sounds like you just gave up
when confronted with changes in technology from what you were
already familiar with ... if that's not the case, you should/would/could
have adapted ... by learning ...

>It's also hard to work on modern rigs, and generally the fix is to find
>out which black box in the set needs replacing and replace it. Big fun.

It is NOT "hard" to work on modern rigs ... (I'm assuming you're referring
to surface-mount technology and the smaller part sizes and higher levels
of integration ...) it's just DIFFERENT. You need a slightly different set
of knowledge/skills and a few simple tools. As is said in my last post,
I routinely work with rather fine pitch ICs (SSOICs, TQFPs, etc.) and
passives (R, C, L) in 0603 chip form. It's different than using the old
"Black Beauty" or Weller soldering gun to solder wires and leaded

parts to octal tube sockets (I've done that, too), but it's not "harder."

The more I read of your post, the more it appears that the only thing
that stopped you from building was an unwillingness to learn and adapt
to the changes in technology that have happened around (and,
unfortunately, bypassed) ham radio in the past several decades ...
I don't mean to be personally offensive, but I think that that combination
of attitude and (in)action is THE worst cancer eating away at ham radio
and its ability to survive into the future.

```
Want: HAL DS-3100ASR Terminal
with or without accessories including
the HAL disk unit.

What do you have?

What condition is it in?

Does it work?

What version of firmware does it have
installed in it (Look at screen on the
'3100 at power-up for the version
number - should probably be 3.x
or 3.xx or some such in the top
left or right hand corner)?

Do you have any manuals for it?

What do you want for it/ them/ the pile
of stuff?

Where are you located?

Thanks for your time

John WB6GHA
HAL owner
occupant@syix.com
...
```

>things like DSP isn't so easy. If hams whine about having to learn simple
>things like Morse Code, just think about the carnage that would result in
>trying to educate them in something as evil as math...

However, there IS a significant distinction ... to the many of us are actually
interested in things like DSP, modern communications system design,
and the theory behind them. Those are skills which have actual, practical
value in today's world and into the future ... the ability to manually encode/
decode OOK Morse transmissions has NO such value to us ...

When I was a child, I thought math was "evil," "boring," etc. When I got older
I realized that it's a fundamental tool for understanding how the world and our
technologies work ... it seems to me that those who merely wish to play games
using radio as a playing field tend to dismiss the value of fundamental skills
and knowledge of the underlying technology ... for many of us it's the raison
d'etre for the ARS (and Part 97.1 seems to substantially agree) ... the funny
thing is that I don't see a damned thing in Part 97 (anywhere) about games,
contests, and the like being "part of the purpose" ...

Better reread S91.1 again; that section contains the reasons for
our existance and our goals. This time pay special attention to
its last paragraph.

Also, pay special attention to all the newsgroups this thread
appears. I've set the followup-line to just r.r.a.misc.

Enjoy the weekend!

Well, I'll concede some merit to your assertions :-). I didn't give up so much as get sidetracked-- working on a math degree at M.I.T. left me with little time for ham radio, unfortunately-- and before I knew it 5 years had passed and the ticket was gone. Took me quite a few years to get back into it, and like most people I am stubborn and set in my ways :-)

Here you can get a CW software that really works !!!

The Morse Decoder MRP37 is a "Just easy to use" Software using your PC +

Sound card. Clear text is decoded and displayed on the screen.
Even under very weak audio conditions MRP37 performs excellent results!
Comfortable Morse sending functions included.

See more information's and get a free demo version at:
http://members.tripod.com/~PEeng/morse

Really good stuff!

Wow, I'm glad you're not the ham God. Just plain ragchewing has always been a big part of the hobby. Nobody should be forced to become technical just to enjoy this part of the hobby. Perhaps it would be realistic to also eliminate the engineering part of the test for those that only wish to use plug and play radios. Making people memorize technical material that they don't understand to get HF privileges is just as much a weeder as the CW test.

4805. Re: PK232 -> DSP Conversion

Newsgroup: rec.radio.amateur.digital.misc

It seems to me that if you already have a DSP box, you don't need the PK-232
to also have it. I use a PK-232MBX with an MFJ-784B and it works
wonderfully. A separate DSP box also gives you versatility for other modes.

I think buying the upgrade AND owning a separate DSP box is redundant.

4806. PK-232MBX Morse Decoding

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-07 00:00:00 UTC
From: Fred M <fmooney@sprintmail.com>
Message-ID: <7227gbbli1@birch.prod.itd.earthlink.net>
Source record: 21507

To decode Morse, my PK-232MBX needs a very strong signal. I can't use the LINE OUT from my receiver--I have to plug it into the amplified headphones jack, and crank up the volume real loud. Way too loud if I want to listen thru the speaker a the same time.

Does anyone else have the same problem, and does anyone know how to modify the PK-232 to accept a lower amplitude signal on Morse??

You may, or may not know, but Kieth Sproul of Mac APRS fame has made a new reader for the new Buckmaster CD Rom format called HamCall 3.3 for MAC. This reader gives the Mac the same lookup capability as the IBM PC readers have, to do lookups in any catagory. You can find info on him by doing a search for APRS on the Web. He may be able to help with the Code. KB8WSG Charles.

Hi Fred,

get rid of these weak concept of PK-232
just try the free demoversion of MRP37 at
http://members.tripod.com/~PEeng/morse
you will be enabled to adjust convinient volume and
the MRP37 is realy pulling even very low cw signals out of the Noise!!!

Marv ... I'm glad you didn't take offense ... none was intended, despite
the fact that I may have been a bit harsh with you considering it was,
I believe, our first exchange.

You sort of hit one of my "hot buttons" though ... the misconception
that modern technology makes it "harder than it used to be to build
ham gear" ... as I hope I stated clearly, nothing could be further from
the truth. And it doesn't have to be an OOK Morse rig, either ...
excellent results can be had in FM, SSB, and digital modes with rigs
built from ICs which actually shield you from much of the complexity
by integrating it onto the chip. Add a few bypass caps, some resistors,
an inductor here and there, a crystal, etc. and you've got a complete,
functioning system.

Why not take a crack at it, if you're still intrigued with building?

73,

I agree that we're luck to still have what we have ... we need to keep
up public service (and keep our capabilities up to what the emergency
services folks want) as well as start showing some technical progress
or I'm afraid we're going to get hosed in a big way in the early part of
the coming century.

The EMS folks don't need/want CW ops any more ... they haven't
in many years ... they want VHF/UHF tactical voice and data and HF
voice and data ... not Morse code.

We need to do a LOT of modernizing if we have aspirations of
survival ... problem is, many of the folks who want to keep things
"like it was in 'the good old days'" will be dead in a few years and
really don't give a rat's ass what happens after that.

Truth is, anyone who wants to homebrew the old way can still do it.
Anyone who wants to homebrew the new way can do it. More opportunities
for homebrewing exist now than have ever existed. It's hams who have
changed, not the homebrewing opportunities. I personally would like
to see a ban on commercial amateur transmitters, akin to the ban
on 11m linear amps. 'Course the ARRL would never go for such.

Note that the very hams who want to force "outdated and irrelevant skills"
on all HF amateurs are the very ones who object to the learning of up-to-date
and relevant skills. Why am I not surprised?

Wow. What ever happened to different strokes....live and let live..ect.
This "if you ain't technical you should be banned" attitude is very
similiar to "if you don't know the code you should be banned". One of
the interesting parts of this hobby is chatting with people in other
professions: teachers, cops, truck drivers ect. Most of them will learn
how to make antennas, install radios, and even build kits, but probably
unlikely to become an engineer that is up to your "technical ham"
standards. If they *really had to know* what is on the engineering part
of the ham test of course they wouldn't have passed anyway. But of
course the test is a laugh as far as determining a persons technical
ability. To reach your goal maybe you should get the ARRL to support a
real engineering ham test.

I thnk that there are other very good reasons for avoiding the circuits and components of the past:

Those 40-year-old designs for transmitters were built largely around the use of Class C frequency multipliers, drivers and finals. Without extensive filtering and shielding, such architecture can result in overwhelming RFI, as witness the 50's when TV first came on the scene and most of us were still using the "old" circuits and equipment. True, the TV sets then were grossly inferior to present-day designs re RFI rejection, but the fact remains that our transmitters today are marked by an almost total absence of Class C stages and other circuitry that generates high levels of harmonics.

I always cringe a little, having lived through those early days, when folks advise new hams to start off with a "good used DX-100" or equivalent. We use SSB for phone and multiple IF transmitters these days for good reason . . .

Thats kinda of a curious stance. You seem to run mostly commercial gear.
IE:Icoms etc.
How often do you run homebrew gear? I'm talking a complete tranceiver,
or homebrew rcvr/xmtr. I built my first xmtr as a novice, but no rigs
since. I do homebrew other stuff though. All commercial gear here
now,but I can fix them if they break. One problem with the new age
homebrewing is info. Alot of the new modules ,componants,chips, etc are
not really advertised unless you subscribe to all the parts co. books.
Or are mentioned in a article. To build a rig I'm sure is not too hard,
to build a rig with all the fancy bells and whistles, I'm not so sure.
Just to dupe my small icom 730 would be quite a homebrew project.And
it's pretty old. I'm all for homebrewing, but everything I see
homebrewed is all qrp stuff. Small size, small features,etc. I don't
hear of too many modern homebrew BIG feature rigs. I don't see any in
the mags that would satisfy me as far as plans go. All I see is mickey
mouse looking qrp rigs. I'll stick with my Icom and kenwood, and drakes
for now I think. MK

Indeed, that is the crux of the matter. Many hams love to berate those who balk at learning Morse (a perhaps fun, but largely outdated and irrelevant skill), yet when faced with learning something ACTUALLY useful, say that it is far too much to expect.

I think it is too much to require people to learn outdated and irrelevant skills, no matter how easy.

As for the difficulty of learning DSP, is it really harder to learn how an FFT works than a transistor? I know that I understand FFTs alot better. Are crystal filters easier to design and use than digital filters? Microcontrollers are cheap and available, and while perhaps your homebrew rig might not look as

nice as the commercial rigs, more and more of the "convenience" functions of modern rigs can be easily added by amateurs. Both Microchip and Atmel sell chips that are easily programmed by any amateur. They are low cost and can

add a great deal of functionality to a radio.

> Ian G4ZJH.

It is featured on the back cover of the US magazine QST published by ARRL.
If it is unavailable to you, i'll describe it.

The radio is grey/silver. On top, the antenna is BNC on the left, 2 tx/rx
LED's in the center and one dual coaxial pot/encoder. The front of the
radio has a 12char X 3line dot matrix lcd at the very top, front mounted
supernintendo style 4way directional pad which is off center to the left,
an apparently small speaker to the right and above of the keypad, and an
18 button rubber keypad.
On the left side there is the PTT and apparently 2 other buttons. on the
right seem to be connections for the serial port.

Features:Directly quoted from kenwood's copy.
->Built in 1200/9600bps TNC (1 pacekt, 1 frame 256 bytes) compliant with
AX.25 protocol
->Dual receive on same band (VHF only) for both voice and data (two
frequencies simultaneously)
->Large (12 digits X 3 lines) dot-matrix LCD, multi scroll key, menu mode
& other user-friendly features
->200 memory channels with 8-character memory name input
->16 backlit keys
->Built-in CTCSS (38 EIA-standard subtone frequencies)
->16-digit, 10-channel DTMF memory
->MIL-STD 810C/D/E water resistance
->High-gain dual band antenna
->High-Speed (9600bps) PC-based packet communications for chat, BBS, etc.
->Kenwood Skycommand System (KSS) II for remote control of fixed HF
transciever-TS-570S/D/(G) or TS-870S (requires optional PG-4R)
->Monitoring DX cluster, TM-742A/TM-V7A remote control (DTMF remote), etc.

APRS details: also quoted from kenwood's copy
->Position/directional data
Hook up to an NMEA-0183 compatible GPS receiver and you can transmit your
exact position for automatic calculation of distance, current speed and
heading. Manual input of latitude/longitude is also permitted.

->Versatile messaging
Transmit your own alpha messages (up to 45 characters),. bulletins,
comments (up to 20 characters), and fixed messages (8 patterns).
->Station List
Store received APRS data in up to 40 memory channels
->Grid square locator
->TX interval
(0.5/1/2/3/5/10/20/30 min.)
->Packet path selection for Digipeat
->Weather station & PHG data reception

Visual Communicator control details: yet again quoting from kenwood's copy
->Text superimpose function
Add your callsign, RSV reports, comments, etc.
->VC-H1 shutter
Command a connected VC-H1 to initiate transmission
->Fast FM
Send an image in just 14 secs (approx).
->SSTV transmission mode (9 modes)
->Dual receive for voice & image transmissions (VHF only)

Ok time for ranting and raving.
WHY NO TRUE DUAL FREAKING BAND?!?!?!?!?!??!!??!?!?!?!?!
WHY NO DCS?!

-Daniel Abranko W4DSA

Hi Bill,

you are right and I agree with you!
Please let me inform that MRP37 provides much more than usual demos do.

The user can verify the performance of the Morse Decoder (Demo) using
REAL CW AUDIO SIGNAL from your receiver!
Just tune a real CW station make a record using record function of MRP37
Then execute playback function and explore ALL full version features MRP37
provides!
Don't hesitate to test MRP37 with weak cw audio signals, MRP37 will manage it!
There is one big advantage using the Play-Back-Mode:
The user can check the recorded signal multiple times; selecting different
frequencies and adjustments of MRP37.
So this way is evaluation and learning how to operate at the same time!

Go this steps:

-Execute C:\MRP373\Rec.bat
-Record up to 12 minutes real CW-audio from your receiver.
-Then exit Morse Decoder by typing Esc Esc
-Then Execute C:\MRP373\Play.bat and operate like advised in readme.txt
-Watch the text window and see Decoder results in time.

4827. BBS software help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-08 00:00:00 UTC
From: wireact@galaxynet.com
Message-ID: <723udu$328_002@news.cnw.com>
Source record: 21527
Cross-posted to: rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.packet,tw.bbs.rec.radio.amateur

Am attempting to set up a BBS network for my county. My goal is to establish about 6 BBS stations running 5w or less on 2mtr running a back-bone on 440. Have been looking for some good software but have not really found mush information on what hardware modifications the various software would require to fit my applications. Need stations to fill the following needs:

stand alone BBS sites-These are just a storage site for forwarded messages and would prefer they run under DOS. Each would have a 2mtr port and 440 port.

Interface BBS sites-These would serve the same function but would also link the local BBS network to existing packet BBS sites and handle message forwarding to the rest of the world. One of these sites will be connected to a network and would need to be able to interact with the network. Would like these stations to run under DOS and do have a copy of NOVEL DOS for the network station.

Mobile network BBS-This station will be in an emergency communications vehicle and will be connected to a network including Red Cross systems. As I believe that all of the local Red Cross computer systems are running WIN 95, this station would most likely also have to run under WIN 95.

Would also like to find terminal software that runs under WIN 95 that will interact with the Red Cross systems. This will allow the Red Cross operators to compose their own messages for HQ that can be reviewed by the ham operator for forwarding.

If anyone has any information that may help me, please send me the information either direct or through the group.

One of my high school Elmers was a lawyer who homebrewed his own
transmitters. He certainly wasn't an engineer.

I agree with you, Keith.

I remember QSTs and handbooks from the 60s had in them projects for tranceivers, receivers, and transmitters that were the equal of any commercial rig. Check out the 1998 handbook-- direct conversion receivers, QRP transmitters, antenna tuners, et al.

If it is reasonable to homebrew sophisticated gear similar to modern commercial rigs, why are there no projects?

From: "A.C. SPRAGGINS" <acs@sccsi.com>
Message-ID: <3645C6B7.2D6A57E@sccsi.com>
Source record: 21534

Howdy:

I've been using an Alinco 582-T on packet for a couple of years now. I plan another trip to Europe next year and want to use the HT for both packet and voice. My problem is that some of the voice repeaters, if not all, require a 1750 Hz tone burst to open the repeaters.

Is there a keyboard programmable way to add tone burst capability? Maybe in lieu of the PL setup or something.

Thanks, and 73

I think you're underestimating the startup costs.

I've been playing with electronics for decades, and have a reasonable connection of electronics tools - crimpers, temperature-controlled soldering iron, power supplies, scope, signal generator, frequency counter, some multimeters, etc. I've done some building with discrete surface-mount parts already, and like it - no pesky holes to drill.

But the only way I have at the moment to produce PC boards is hand-drawn etch resist, or the method of covering the board with adhesive tape and cutting and stripping the tape from areas to be etched. Neither of these is practical for multi-lead surface-mount ICs. To use these, it appears that I will need a PCB layout program of some sort, as well as a PC and laser printer - I have none of these (I use a Mac and an inkjet printer).

Using PICs, EPROMS, PALS, or GALS requires a programmer plus programming software. DSP development kits also cost significant money. Emulators for debugging this stuff cost *lots* more.

Actually writing software doesn't bother me - that's my background. But the cost of all of the associated hardware is daunting. I'd guess that it would cost $3K-4K (CDN) to obtain most of the stuff named above (without the in-circuit emulators). That's nothing at all for a business, but it's a significant amount of money for a student, and many times the cost of a commercial transceiver.

Things are improving. PCs are now usable computers, and the next machine I buy will be a PC. There is now one place in town where I can buy a small selection of surface-mount parts in small quantities. (A few years ago there were none). Digi-Key has a Canadian arm now.

I think that engineers working in the electronics industry don't have any idea how much more difficult it is to obtain resources that they take for granted when you are an outsider. For a while, I worked at a place that did a lot of electronic design work, so I had access to data books and good test equipment and an IR reflow oven and solder paste applicator and many other neat and useful things. But I lost access to all that when I left, and I'm dependent on my own resources now - which

are limited.

Dave

4846. Good WINDOWS wefax / navtex program wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-09 00:00:00 UTC
From: Steve <director@scotia-technologies.co.uk>
Message-ID: <19981109140527859 11@scotia-technologies.co.uk>
Source record: 21347

I would like a good WINDOWS (3.x / '95) program to receive WEFAX and probably NAVTEX too.

I would be willing to pay upto around 50UKP, but would like to see a demo first.

Anyone know any such programs?

I quite like the sound of the PC Maritime's Weather fax for windows, but it's a bit too pricey for me.

Thanks
Steve

A Mac? Lets see, that's Apple's little Etch-A-Sketch, right? :-)
The graphic design industry seems to like it, and there are
a bunch of cheap or free graphic layout programs for it. (There
are better free tools for the PC, purpose written for board layout,
and more of them, but there are tools for the Mac which will
suffice.)

An inkjet printer is fine for printing on transparencies to make
exposure masks. Epson has some special inkjet transparencies
just for such use. You can also print 2x on paper and go to Kinko's
and have it reduced onto a transparency for a few quarters.
(This is actually the better way to do it. The extra quarters are
to do a few test copies to get the copier adjusted to exactly the
right reduction before you shoot the transparency for real.)

A cast off aquarium, pump, and heater, make a dandy bubble
etcher for free. And old Bessler enlargers can often be had
just for carting them away (the photo industry has gone to
computer printing). This way your transparency doesn't have
to be exactly 1:1, as it would have to be if you contact print.

>Using PICs, EPROMS, PALS, or GALS requires a programmer plus
>programming software. DSP development kits also cost significant
>money. Emulators for debugging this stuff cost *lots* more.

Well, once more you're hamstrung by the Mac. You can build a
PIC programmer for about $2 that works off the printer port of
a PC. For about $5 more, you can make it program PALs and GALs
too. The software to drive it is free, and available for download
from the net. A suitable DSP development kit for amateurs is
the Analog Devices EZ-Lite series, cost under $100. An ICE
is much more expensive, but a clever amateur can avoid the
necessity for an ICE with a bit of creativity. (I've always found
ways to debug systems without resorting to an ICE.)

>Actually writing software doesn't bother me - that's my background.

>many times the cost of a commercial transceiver.

You guess wrong. Once you have the PC, the rest of what you need
won't cost much at all. Now you won't have a slick development package
like a $13,000 professional package, but it will do for an amateur on a budget.
In fact, up until a couple of months ago you could get a demo version
of that $13,000 package for free. It was limited to 30 devices per
design, but otherwise completely functional. A clever amateur could
break his project up into subsystems of less than 30 devices each,
and have all the advantages of a full blown professional design package.
(That's exactly what this clever amateur does. I have schematic
capture, spice simulation, board layout, and autorouting, all available
at the click of a mouse, and I didn't spend a dime for it.)

>Things are improving. PCs are now usable computers, and the next
>machine I buy will be a PC. There is now one place in town where I can

>(A few years ago there were none). Digi-Key has a Canadian arm now.

I don't know if Tech America ships up there, but I found out that they
have just started carrying small quantities of solder paste. That's
been hard to find in small amounts (and an amateur can't use up
a large amount before it spoils, solder paste doesn't store well).
I've been bumming paste from a local board house which buys it
in bulk. Now I can just drop by Tech America and pick up a small
amount when I need it. They have SMD parts on rolls too.

>I think that engineers working in the electronics industry don't have
>any idea how much more difficult it is to obtain resources that they
>take for granted when you are an outsider. For a while, I worked at a
>place that did a lot of electronic design work, so I had access to data
>books and good test equipment and an IR reflow oven and solder paste
>applicator and many other neat and useful things. But I lost access to
>all that when I left, and I'm dependent on my own resources now - which

>are limited.

Well, you just have to be a bit more clever. I still get some data books from the manufacturer's reps (you can usually get last year's books for free, just ask nicely), but mainly now you'll find the data is published on the web in PDF form, so you can download it as you need it rather than having to keep a large paper library.

Good test equipment can be important, but it can also be 5 or 10 years old (or even much older in many cases) and available very very cheaply on the surplus market. It isn't as push button automated as the new stuff, but it serves very well. Most of my test equipment is older HP and Tek stuff that I bought dirt cheap at hamfests. (Some of it needed a little work, most didn't.) My test bench has equipment totaling tens of thousands of dollars new price, but I didn't buy it new and only have hundreds of dollars invested in it.

You don't need an IR reflow oven, a little Pyropen Jr with a static hot air shroud and a steady hand will do. And the solder paste applicator is a wooden toothpick in my shop. I'm not in the mass production business, so I don't need the sort of equipment needed for that. You don't either. My SMD tool kit is a Pyropen Jr, a good jeweler's loupe, a sharp pair of tweezers, some wooden toothpicks, and a bit of modeling clay (the latter is to form heat dams so you don't reflow something you don't want to reflow when doing rework). You don't need a $1200 SMD rework station. In fact, though I have access to one of those, I find them usually more of a bother than a help. I can have the job finished before I could get everything disassembled and mounted on the stupid thing so I can use it. Again this is something you'd want in a production shop, but an amateur isn't running a production shop, so he can do without it.

Finding ways to do things cheaply, but still achieving professional results, is half the fun of working as an amateur. You can substitute a little ingenuity for a lot of dollars.

Very good question. I think there is very likely many reasons why you don't see such projects anymore.

Probably top on the list is the fact that commercial rigs have gotten much cheaper and much more capable. If you _aren't_ interested in homebrewing per se, but merely seek to get on the air inexpensively, modern rigs are an excellent solution. A certain number of those who used to homebrew were doing so largely as a matter of economics rather than real interest. The economics have shifted, and now these people can operate without the tedium of assembling a station from scratch.

Another reason undoubtably has to do with the rise of the Tech licensees. Techs operate on VHF+, in bands where traditionally hams have done relatively little homebrewing. Heck, it is pretty difficult to find any real ham literature on building (say) a 2m fm transciever, inspite of the fact that modern chipsets make it relatively inexpensive and simple. Is such a radio as fancy or small as your modern HT? Probably not. Can you learn alot from building one? Sure. And that is at least one of the major goals of amateur radio. Even if we do use commercial radios, we are supposed to know something about how radios work, and homebrewing is an excellent way to get hands on experience in how radios work.

Lastly is a question of focus. Much of the homebrewing that one sees is centered in the HF bands, mostly Morse, and mostly QRP. Why is that? My guess is that it is because most commercially produced radios are poorly suited for the type of operation that these people like to do. You can design and build a compact, simple, low power rig and put it in a nice small box. It can be cheap (< $100 easily), be relatively stingy on battery power, and suitable for portable operation. Because it is cheap, it doesn't need to be all things to all people. The QRP community has focussed on some important goals, and has delivered quite a number of designs that work quite well.

The unfortunate things is that other groups have not done the same. Recently on the back of QST there have been Kenwood rigs that act as either SSTV transcievers, or as GPS/APRS beacons. Pretty nifty gadgets. While reproducing the same level of compactness and ease of use is challenging, the availability of cheap FM radio components, cheap microcontrollers and dsp means that you can do much of the same sort of thing yourself, and much cheaper than Kenwood will sell it to you.

Want some ideas about fun, cool, inexpensive projects to do?

a) a number of designs for differential gps decoders are floating around the net that can be coupled with a commercial gps receiver to yield high accuracy positioning. The cheapest design I've seen costs about $25. The most expensive, maybe $100. b) How 'bout interfacing an ordinary digital camera to your HT for a SSTV encoder? No TNC, no PC. Just a small microcontroller that takes the pixel stream from the camera and sends it via sstv. Cheap digital cameras are dropping below $200, some even as low as $99. A PIC or Atmel microcontroller probably has enough oomph to make the encoder. c) How 'bout a portable QRP RTTY rig? PC keyboard for input, LCD display? d) Digital VFOs? The Analog Devices 9850 is a cute (if teensy) chip. Last I looked, they were around $20. e) DSP demodulators for the R2 receiver? Look at the SETI League's reciever, or articles in QST.

Just some ideas..

Mark

This isn't a very good excuse against using PICs or (my personal favorites)
Atmel microcontrollers. A number of VERY cheap programmers with free
software are available for both chip families. The Atmel chips I've been
using have 2k of flash memory on them, with a UART, an analog comparator, and
several other useful goodies. Atmel's own development kit costs $50, but the
software they give you can all be downloaded from their webpage. They have
both assemblers and simulators available. Very nice.

In-circuit emulators are nice, but you CAN develop programs without them.

You can experiment on a shoestring. Much of the equipment you mentioned is
nice to have, but far from essential.

The Internet has helped me locate suppliers for chips that a couple of years
ago just wouldn't have been available to me. Mail order is an excellent way
to go. Sometimes it does seem some creative begging/reorganizing is required
to get over some minimum order humps, but it is possible.

> are limited.

Consider them challenges. One thing to consider is that if you are going to encourage homebrewing, not many hams would have all the test equipment you had anyway. A key part of the success of QRP homebrewing efforts is that people SHARE ideas and designs, and they get reused. Is it cool to use a $300 Xilinx FPGA to make a Reed Solomon decoder? Maybe, but I doubt many hams will be willing to cough up the bucks to make one. On the other hand, if you say "Gee, you can make a tremendously cool Morse encoder/decoder using this $3 chip, a few audio filters, and a $10 programmer you can build yourself", you might get more people interested. And that benefits the ARS as a whole.

Folks,

I'm not sure that new rigs have become all that inexpensive relative to other things. For example, in 1973 it was possible to purchase a high-end HF transceiver for about $400 and a legal-limit amplifier for around $1,200. Now these range from $1,500 - $8,000 for the transceiver and $1,800 to $4,000 for a legal-limit amp (source: HRO catalog). This isn't much progress in pricing.....it's like buying a new car once you have the tower/antenna and rig in place. The situation for VHF/UHF isn't much better. What's needed is a return to "discretionary income" pricing levels -- after all, it's just a hobby -- right?

On the inside rear cover of my August 1959 CQ magazine is advertised the National NC-400 receiver. Suggested list price is $895. With inflation that's about $9000 in today's dollars and you still have to buy the transmitter. Now that was a top of the line receiver, but that's still way more than today's expensive stuff.

I plugged $400 into a calculator that adjusts things for inflation, and $400
in 1973 inflation adjusts to $1483 or so in 1997 dollars. Of course, modern
transceivers are generally much more capable than the transceivers available
in 1973, supporting a wider variety of bands and operating modes. I'd say
in some very real terms that prices have fallen, and capabilities of modern
rigs has gone up.

4863. Info requested on NON AMATEUR wireless TCP/IP networks

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-10 00:00:00 UTC
From: Napoleon Maou <maou@ics.forth.gr>
Message-ID: <36480ADB.7264127E@ics.forth.gr>
Source record: 21364

Hi,
I am interested in setting up a wireless TCP/IP LAN to connect my
computer with those of some friends.
My experience on setting up wireless networks is nill. I have read
articles and collected information about amateur
TCP/IP networks but I have found no information on setting up non
amateur wireless networks.
Since my friends are not amateur operators I can not use amateur
equipment to setup the network.

I looked for information on wireless radio modems and I found 2.
Maxon DM-0500 and ELPRO 405U. But I found no information if these modems
can be used with TCP/IP software.

Does anyone know of any sites where I could find information about
setting up non amateur TCP/IP networks?
Information on equipment that I can use is also wellcomed. Have in mind
that our budget is minimal.

Thanks
Napoleon

Now correct that 1973 price for the inflation started by Lyndon Johnson's
"guns and butter" budgets (multiply by 8). That 1973 transceiver costs
$3200 in today's dollarettes, and that linear costs $9600. But in real life,
a transceiver much better than a top of the line 1973 unit can be purchased
for about $1600 (and ones better than the average 1973 transceiver for
under $1000 street price). And a good linear still costs under $1200.

While our salaries generally haven't kept pace with inflation, most of us
are still making a large multiple of what a comparably skilled person was
making in 1973. So while today's radios might not be fully 8 times cheaper
in terms of man hours of labor, they are still considerably cheaper than in
1973.

Incentive licensing in concept was probably a good idea at the time it was first discussed, but they way it was put into practice created a terrible situation which still has consequences today.

Sometime in the early 1950s, someone proposed that everyone who held a General or higher license be granted all amateur operating priviliges. It was about that time when the Novice and Technician class licenses came into being. The Novice was good for one year and not renewable. It was either up or out after that year. The Technician was designed for technical experimenters and was limited to operating priviliges, I think from 220 Mhz and up, with 50 and 145 Mhz being added later. In order to get the Technician, you had to pass a mail order written test which was the same as the General, and a 5 WPM code test if you were not a Novice and already had credit for it. I think that a Novice and Technician license could be held jointly by the same person if the Novice time limit had not yet expired.

In effect, the General class was the top of the line license as far as operating priviliges were concerned. After 1952, testing for the Class A (Advanced) license was dropped, although existing Class A holders could continue to renew as Class A.
No additional priviliges were granted to Class A operators.

This was the way of the ham radio world for 14 years.

In the late 50s, some deep thinkers somewhere decided that hams were not improving themselves for some reason. They were not changing over to SSB

as fast as they should and these deep thinkers thought it may have been because many of them were too technically ignorant about the then state of the art. In some quarters this was a scandalous situation. There was much discussion of finding a way to force technical competance via the testing and reserved operating privilige process. There was also some concern that many hams were letting their code skills slip because they spent too much time on phone. The appliance operator label was just coming into vogue, and it was thought that valuable design and building skills were being lost. This debate raged in the pages of QST for over 5 years.

The final result was that on a specific date in 1968, anyone who was a licensed General class operator lost a good amount of their operating priviliges on HF. Anyone who held the old Class A (at one time the top license in terms of operating priviliges) also lost a considerable amount, although not as much as the lowley General did. The Extra Class license became the new top of the heap and if you wanted your priviliges back, you had better pass the Extra exams with its 20WPM code requirement.

INHO the largest problems with Incentive Licensing were:

1.- Taking away priviliges that already had been earned. It should have affected new people entering the service, but everyone else should have been grandfathered.

2.- The most talked about reason, technical competance or the lack of regarding SSB had been effectively bypassed by the availability of commercial equipment which actually needed less ability to use than the old AM equipment. By 1968 the
technical argument was moot. Most of us were turning into appliance operators anyway.

3.- It caused a meltdown in the interest of ham radio in the years immediatly after 1968. Take a look at the size of the Cq, and QST magazines of that period.

4.- It was one of many reasons why American ham equipment manufacturers started to go out of business.

I will always believe that Incentive Licensing amounted to a power and privilige grab by a very few people in power at the ARRL who wanted what amounted to a "country club" operating privilige setting for the good ole boys in their circle. For a very long time I thought that the ARRL and the FCC thought that General class and below license holders were held in contempt. I was a memeber of a ham radio club in the late sixties which had a sign saying "ARRL's definition of a real ham...Extra Class License... 2 letter call" It took a long time for me to get over it.

It is interesting to note that the ARRL is doing everything it can to make sure that no one looses operating priviliges with the coming license restructure. I think this stems from bitter past experience.

Folks,

I suppose it's proper to think about these prices in terms of inflation,
but I've yet to see a legal-limit amplifier for $1200. For example, the
Ameritron 1500W units are all over $2000 (AL-1500: $2,695, AL-82:
$2,195). Rigs of reasonable capability are also pretty pricey today:
(FT-1000D: $5,459, TS950SDX: $5,299, IC-R9000 (RX) $7,508...etc). Aside
from filters and DSP "frosting" (and WARC bands), these rigs do not
perform much differently from their 1973 counterparts. I've made A/B
comparisons between an old Yaesu FT-DX 560 with a second VFO (250w
output all tube rig), a receiver preamp and a 400Hz CW filter with a new
FT-1000D, and for most normal operating situations, they have comparable
capabilities. While I agree that receiver selectivity is nicer on the

FT-1000D, the technology used in the FT-DX 560 is within reach of the homebrewer, while home-brew of an FT-1000D clone would be nearly impossible. I think that the thrust of this thread relates to whether one can build well-performing rigs for less money than buying them. While it would be a major project, I think that is it still possible to home-brew good quality amateur equipment for reasonable prices.

>

HI Gordon Grey.

We are to persons here in Denmark, that have been trying for some time now,
to get
the ft-8000 and the ft-8100 to work 9600. but we cant get it to transmit so
other pepole
respond. The RX is ok, but the TX is not working. the 9600option on the radio
dont help.
We have used soundcards and for now we are trying with a TMS320c50 DSP kit.
We have used the dsk50 driver for flexnet.
Now we are also trying with a FT-847, same "luck", if i may call it that..
:-(

Does someone know any tricks or hints, that could help us with our work.??
Then your most welcome to reply on this msg. Pse make your reply to me
personal aswell.

Thanks for your time. Good DX and keep up the good help we see in this
groupe..

Gary,

Not to nit pick, but according to the official CPI measurements (found at
http://www.NewsEngin.com which is a resource for working journalists))
$400 in 1973 would actually be worth $1,427 in 1997 dollars. Multiply by
3.568.
Still a lot of money.

The return of the all priviliges General license would make the
oldtimers whole, as well a simplifying the license structure as the FCC
requires. The elimination of the Extra Class license would be logical
for simplification, but now another group would be mad for wasting their
time testing, and of course how would we know who to give the status 2
letter calls to?

> Still a lot of money.
> 73 George W3GEO

Thats probably an *average inflation* multiplication figure. Some things deflate while most inflate. I always figured multiplying the price by ten from the 50s when I was young. A Coke was a nickle then but .50 now. A car was $2500 then but $25000 now. But that doesn't always work. A transistor radio in the middle fifties went for a couple hundred dollars, but a couple of dollars now. A B&W TV was $500 then, but a similiar size color TV is $200 now. The last 2 examples were deflation. Computers are in deflation mode right now. Comparing the accurate dollar value of todays and yesterdays radios using a standard inflation formula may not be completely accurate. But I agree that today's radios are a much better value than in the past.

More often than not, I get *this year's* data CD's just for asking.
If one has the guts to walk into an electronics trade show, they'll do
quite nicely. I've done this a lot and if you're nice, polite,
curious and *persistent*, you can get good info, occasional freebies
and learn a hell of a lot. Technical reps love it when you talk to
them in specifics about a pet project, whether it's yours or theirs.

(The web, generally, has made it *much* easier to get info from the
manufacturers. Fill out forms on their website and you'll often get
CDs, mailings, sometimes even samples.)

OK, so why is the DSP chapter in the ARRL Handbook so *opaque*?
I don't hate math, but math education seems to hate me. Did lots of
math for my CS. Agree wholeheartedly that it's important. All but
failed miserably at it. (I worked like a dog just to get by.)

Lacking a "DSP for Dummies", it may forever be opaque to me. Pity,
not for lack of trying. This isn't a Luddite rant BTW. I like
advanced technology and want to see hams using some, rather than
trapping themselves with CW. And I am _second to none_ when it comes
to the desire to learn new things. (Hewlett-Packard has an excellent
tutorial on digital modulation on the web, and I feel like I'm the
only ham who's read it.)

But I do wish some of the CW proponents who tell me I am not trying
hard enough, would take a higher-math curriculum, or some other
specialty that is brutally difficult, and get no other help than "Try
harder and stop whining, #$#$!@##$#@!" Preferably math taught by some
of my professors, who had absolutely *no* clue on how to teach (a
problem with the math field in general.)

When this issue last came up a few years ago, weren't you the one to
point out that EE's, especially newer EEs, weren't really "with it" as
far as practical experience? Bob Pease complains about this all the
time in his columns, and the posted experiences of a few EE's seem to
bear this out ("I'm a BSEE and I don't know how to fix my TV!", for
example.)

:> skills, no matter how easy.

Show me what's outdated and irrelevant about tradition ? Ham radio communications, in fact, all wire and wireless communmications, began with Morse Code. What's so irrelevant about learning it ? I do believe that a 12 WPM proficiency test is the only cw test anyone should make anyone else take, and only because it's an ITU requirement. Not just the arrl, but the whole world. I also believe that every ham should build at least one functional cw transceiver in his ham career, maybe before he gets signed off to take the test to upgrade.

: Note that the very hams who want to force "outdated and irrelevant skills"
: on all HF amateurs are the very ones who object to the learning of up-to-date
: and relevant skills. Why am I not surprised?

Outdated and irrelevant are still in use. There are tubes in use in Linear Amplifiers, so you should know them. There are transistors that are used in modern rigs, so you should know them. There are RF safety factors involved, you should know them. BTw, do you want to use data on the air ? How about explaining the Kiss protocol, ax25, tcpip, and the functions of a tnc before testing ? Wait a minute, how about the declination of an orbiting platform ? What is the optimum circumference of a radiator made for a certain band out of aluminum ? Believe me, you should know about discrimination in an FM transceiver. YEah, these old guys, they make it really tough on you.

Hello George,

I partly agree, and partly disagree. The idea was good, but the implementation
wasn't.
>
> Sometime in the early 1950s, someone proposed that everyone who held a
> General or higher license be granted all amateur operating priviliges.

Actually, it's a lot more complex than that. From the early '30s until 1951,
there were effectively two classes of ham license - Class A, which became
Advanced, and Classes B&C, which became General and Conditional,
respectively. All required 13 wpm code, but the Class A had a much tougher
written test, required 1 year of experience, and the test could only be taken
at an FCC examining point - and you got no credit for exam elements taken by
mail. The reward for a Class A license was the ability to use voice on 20 and
75 meters - Class B and C hams' voice privileges were restricted to 160, 11,
and 10 meters on HF, and VHF/UHF. There were no 30, 17, 15 or 12 meter bands
then, and 40 had no phone segment.

In 1951, the FCC made some major changes. The Novice, Technician, and Extra
Class licenses were introduced, the A, B and C licenses renamed, and the FCC

announced that the Advanced would be phased out and that an Extra would be needed to have access to all amateur privileges.

> It
> was about that time when the Novice and Technician class licenses came
> into being. The Novice was good for one year and not renewable. It was
> either up or out after that year. The Technician was designed for
> technical experimenters and was limited to operating priviliges, I think
> from 220 Mhz and up, with 50 and 145 Mhz being added later.

Agreed. The Novice was meant as a sort of learner's permit, and you had only one shot at it per lifetime - you couldn't get another Novice, even if you took the test again.

> In order to
> get the Technician, you had to pass a mail order written test which was
> the same as the General, and a 5 WPM code test if you were not a Novice
> and already had credit for it.

Novice and Tech were given at both FCC offices and by mail until 1954. You had to live 125 miles from an FCC quarterly examining point to take an exam by mail. In mid-1954 the Novice and Tech became mail-only, and the Conditional distance shrank to 75 miles.

> I think that a Novice and Technician
> license could be held jointly by the same person if the Novice time limit
> had not yet expired.

Absolutely. The holder had two callsigns, and which one you used depended on the band. The same person would be WN3XXX on 80 CW and WA3XXX on 6 meter phone.

>
> In effect, the General class was the top of the line license as far as
> operating priviliges were concerned. After 1952, testing for the Class A
> (Advanced) license was dropped, although existing Class A holders could
> continue to renew as Class A.
> No additional priviliges were granted to Class A operators.

Nor to Extras.

What happened was that after years of announcing that the Extra was going to be the top license, the FCC did a quick about-face and did exactly the reverse, giving all privileges to Generals and above. There were about 40,000 Advanceds and Extras at the time who saw Generals/Conditionals get the same privileges they had taken much tougher tests to get.

>
> This was the way of the ham radio world for 14 years.

1953 to 1968, I think. I can look up the exact dates. Actually a very short time, historically.
>
> In the late 50s, some deep thinkers somewhere decided that hams were not

> lost.

The concern came from the FCC, who had started the whole trouble to begin
with.

>This debate raged in the pages of QST for over 5 years.

1963 to 1968. Some wag coined the phrase "invective licensing", which was
pretty accurate.
>
> The final result was that on a specific date in 1968, anyone who was a
> licensed General class operator lost a good amount of their operating

> became the new top of the heap and if you wanted your priviliges back, you
> had better pass the Extra exams with its 20WPM code requirement.

It was a little more involved in how this came about. The FCC expressed
concern about the situation in the late '50s and early '60s. The ARRL
responded in 1963 with a simple proposal (RM-299) - go back to the old
system, where an Advanced would be needed for 20 and 75 phone. No complex
mess of subbands, just bring back the old system. The FCC asked for comment,
and got a pile of them. No less than 10 got RM numbers. From these came the
idea of subbands, and three layers of HF privileges beyond Novice. It also
produced some other ideas like replacing the Advanced with a new "Amateur
First Class" that would require 16 wpm code and a tough written exam,
existing Advanceds being demoted to General, and a two-tiered phase-in that
would reduce the Generals' HF privileges by almost half - phone and CW. The
last three were fortunately defeated by protests from the ARRL and others.
You should see the FCC's proposal of 1966 - it makes what actually came to be
look mild.

>
> INHO the largest problems with Incentive Licensing were:

> operators anyway.

The development of amateur SSB transceivers and grounded-grid linear amplifiers meant that a ham could buy a legal limit sideband station for about as much money as building a 250 watt AM station from new parts. And it took up a lot less space. When companies like Heathkit offered rigs like the SB-100 for about $400 (as a kit, but with power supply), the future was clear.

Some of us, however, did not turn into appliance operators.
>
> 3.- It caused a meltdown in the interest of ham radio in the years
> immediatly after 1968. Take a look at the size of the Cq, and QST
> magazines of that period.

In some circles, yes. I was first licensed in 1967, and didn't understand what all the fuss was about. I thought,"So you get your code speed up a little bit and study for a written test. What's the big deal?" But many others felt their "rights" had been violated.
>
> 4.- It was one of many reasons why American ham equipment manufacturers
> started to go out of business.

Possibly. There were a lot of other reasons, many of them simple economics.
>
> I will always believe that Incentive Licensing amounted to a power and

> contempt. I was a memeber of a ham radio club in the late sixties which
> had a sign saying "ARRL's definition of a real ham...Extra Class
> License... 2 letter call" It took a long time for me to get over it.

The FCC, not the ARRL, was the instigator of the whole thing. I sometimes wonder if "Sputnik fever" had something to do with it - after Sputnik went up, and the Russkies started winning the space race, there was a lot more interest paid to science and technology.

The ARRL concern, as I see it, was that ham radio was on the road to becoming a strictly hobby service, full of folks with little technical knowledge and few operating skills who used store-bought equipment that they didn't really understand. They were afraid that such a service would not be able to justify its spectrum allocations, or even its existence, for very long. They were trying to reverse trends they thought were not in the best interest of ham radio.

There was also the fact that the FCC was going to do something, no matter what. So the League leadership had to do something that the FCC would accept - they thought if they just said no to the whole thing, the FCC would come up with something much worse. Look at the 1966 FCC proposal, and think what ham radio would have been like if it had been fully implemented.

Support for incentive licensing was split almost right down the middle, with a very slight majority in favor of it, by most reliable polls. The trouble was that the opposition was very bitterly against it. The bad feelings echo to this very day, 30 years later.

>
> It is interesting to note that the ARRL is doing everything it can to make
> sure that no one looses operating priviliges with the coming license
> restructure. I think this stems from bitter past experience.

I agree 100% on that point.

BTW, incentive licensing went into effect November 22, 1968, almost 30 years ago exactly. The second phase, set for a year later, was never put into effect by the FCC.

>requires. The elimination of the Extra Class license would be logical
>for simplification, but now another group would be mad for wasting their
>time testing, and of course how would we know who to give the status 2
>letter calls to?

Simple:
The FCC mandates all U.S. amateur licenses to expire at
11:59 p.m., UTC, December 31, 1999.

The FCC mandates all current amateur radio licensees must
re-test prior to that date and time in order to be licensed
at the level of examination for which they pass all the
required components. Prior license level irrelevant and be
damned; no "grandfathering," no "good ol' boy" actions
permitted.

A 90-day grace period, beginning 0:00 a.m., UTC, January 1,
2000, will allow "last-minute exam-takers" to continue
operating while their examination results and applications
are processed.

Those current licensees who do not re-test, or who the FCC
says are not yet certified as licensed by the end of the
90-day grace period, must cease operating until such time
that they re-test and are officially certified by the FCC as
licensed.

Piece of cake.

Everybody wins: Equal opportunity testing; trying out the
new licensing standards (whatever they come to be); more
stuff for the VECs, ARRL, Fred, et al, to do.

Now *everybody* can whine ... ;0)

The antenna connector is an SMA - basicly the radio looks similar to a TH-G71, but slightly larger due to the large display a keypads.

I've personaly held one and really works. At the Digital Communication Conference we received various 9600 baud pacsats simply with a 4 element yagi and a laptop. The TNC signs on like a TNC2 and it does have kiss built in.

Hope this helps someone

PC-FlexNet does a great job. You actually end up with something with features far in advance of any of the "real" TNC's which come in a box. See my web-page, listed below and push the "FlexNet" button.

There's an article in there on using the soundcard as a TNC, showing how to hook things up. Good luck!

From: ggrey@nojunk.ihug.co.nz
Message-ID: <364a84b2.11268792@newsource.ihug.co.nz>
Source record: 21405

Hi,

Various magazines review tranceivers that have better 9600 performance
than the FT8000. I have found the FT8000 to works reasonably well with
a simple antenna with 7dB gain on 70cm and some 23km from the club
transmitter. I use my FT8000 on medium power output.

Here is a copy of my wiring notes. Hope they are of some help.

FT8000 to DSP-232 TNC connections:

FT-8000
CT39 cable DSP-232, Radio 2 , Din
Pin Colour Pin Function
1 Yellow 1+6 (1)Tx1200,(6)Tx9600
2 Orange 2 Ground
3 Green 3 PTT
4 Red 7 RX9600
5 Black 4 RX1200
6 Purple 5 Squelch

Flexnet connections PC to FT8000.
I had problems understanding the Flexnet notes for sound card
connection. When I plugged my speakers into the sound card speaker
output I found that I heard 9600 packet being output. This TX audio is
fed to the FT8000 for transmit. I have obtained PTT from a COM port,
pin 4. I used a Motorola MPSA14 NPN darlington transistor to drive the
PTT. I used the same connector cable shown above from my FT8000.
I unplugged the cable from my DSP-232 and plugged it into an 8 pin Din
connector wired to the back of my computer sound card and Com port.

DB25
Socket
Pin
4 ---- 10K-- to base of transistor
7 ----------- to emitter of transistor
Collector to PTT, pin 3 of Din socket

Din Socket
Pin
1+6 Sound card speaker jack plug centre
2 Skr and Mic jack plug grounds
3 PTT transistor collector
4 No connection
5 No connection
7 150K resistor to Mic jack center

8k2 from mic jack centre to ground

I found that I did not have enough audio output from my FT8000 to drive the Line input of my sound card and I had too much for the Mic in. I therefore used an attenuator divider of 150k and 8k2 in series to ground to better suit the sound card mic input.

Hi,

A couple of follow up notes to my previous posting.

The Din connector pin 8 has no connection.

There is nothing like listening to the 9600 being transmitted by using another receiver. I used a handheld receiver which is not capable of 9600 but I could get a good audio comparison by ear of the club 9600 trasmissions compared to my own.

The Handbook chapter may be poorly written because the authors haven't the knack for distilling a subject down to its essentials in a small space. It requires a deep understanding of a subject to communicate it well. That's why I generally find physicists to be the best math teachers for engineers. They are trained to see the concrete physical links between phenomena and the math models used to model them. The math major often can't see beyond the manipulation of equations, and the engineer often doesn't have the necessary deep physical insights into the phenomena.

But even so, it is fairly rare to find someone who understands a subject deeply and is also competent to convey that understanding to others. People like Feynman who can vividly convey the connection between the reality and the model don't come along every day. And there is a related problem. First you have to understand the signal before you can understand how to process it. Many amateurs don't have that understanding, so naturally they become lost in an explanation of DSP.

But there are books which do a good job of explaining things in terms that the reader can grasp. As I usually do, let me recomend Stephen Wilson's _Digital Modulation and Coding_ as a starting point. He gives you the needed background to understand signaling theory and signal construction in an extremely lucid fashion. After you read Wilson, tackle _Modern Signals and Systems_ by Kwakernaak and Sivan. With Wilson as a lucid background, it will expand your view to include general analog signals. Now you'll be equipped to understand the sorts of digital and analog signals you're going to digitally process.

Then you can go on to actual DSP texts. One such text that I'd recomend is _Digital Signal Processing, A Practical Approach_ by Ifeachor and Jervis. If you hit this one cold, you'll be hopelessly

lost. But if you first develop the background provided by the two books I mentioned earlier, it will make sense to you. Only at this point should you tackle the manufacturer's DSP databooks. That'll teach you the mechanics of implementing the algorithms you'll have come to understand.

There is no DSP for Dummies, and there likely cannot be such a book for those who wish to develop DSP systems. It could only tell you how to *use* a system developed by someone else. Well, perhaps I'll retract that and point you to Oktay Alkin's _Digital Signal Processing, A Laboratory Approach Using PC-DSP."
It sort of falls into the DSP for Dummies category in that it tells you how to use an existing software tool. But without the background provided by the other books, you won't really understand *why* the things you're told how to do work.

>time in his columns, and the posted experiences of a few EE's seem to
>bear this out ("I'm a BSEE and I don't know how to fix my TV!", for
>example.)

Yeah. A newly minted EE is pretty much a blank slate, ready to have
the practical matters not covered in his education transferred to him
by experience. He has more than enough background to understand
his job, but he lacks the experience to know how to carry it out in the
most practical way.

The technician often has a wealth of practical experience, but doesn't
have the theoretical background to put it into context. He knows lots of
tricks for dealing with specific problems, but often doesn't know why they
work, or how to apply them to a novel context.

Ideally, what we want is something which blends the two, taking from the
EE the deep knowledge necessary to understand a new context, and taking
from the technician the tricks of the trade which can be applied to the
problem. We don't need the breadth of the EE's knowledge, but we do
need its depth in certain narrow areas. Fortunately, our curiosity as
amateurs can drive us to seek out the necessary depth in the areas of
specific interest to us without requiring us to undergo a full EE curriculum.
Experience we get the old fashioned way, by hands on experimentation.

PC-FlexNet does a great job. You actually end up with something with features far in advance of any of the "real" TNC's which come in a box. See my web-page, listed below and push the "FlexNet" button.

There's an article in there on using the soundcard as a TNC, showing how to hook things up. Good luck!

Unfortunately it is illegal for U.S. hams to use 1200 baud FM packet on
10m (I found out the hard way)
we can only use 1200 baud AFSK in the cw subband (28.0 - 28.3) but,
it seemed to work better than FM anyway.

Unfortunately it is illegal for U.S. hams to use 1200 baud FM packet on
10m (I found out the hard way)
we can only use 1200 baud AFSK in the cw subband (28.0 - 28.3) but,
it seemed to work better than FM anyway.

Tigertronics has a 9.6kb "Pic-Par" modem, which connects to the PC's
parallel (printer) port.

BayCom also makes a similar unit.

The PK-232, HK-232 and PK-232MBX are all serviced and upgraded by Timewave
Technology. There are several options:

Upgrade PK-232 or HK-232 to PK-232MBX kit is $100
Upgrade PK-232 or HK-232 to PK-232/DSP kit is $150
Upgrade any PK-232MBX to version 7.133 (last non-DSP upgrade) is $50
Upgrade any PK-232MBX to version 7.2 (PK-232/DSP) is $125

Repairs on any PK-232 is $75. If you have an upgrade with a repair the
repair
is only $50.

PC PakRATT for Windows ver 2.0 is available with any upgrade for $69 ($10
off
list price)

the heart of the system is a directional atenna. distance is not possible as
far as
I know.
several types are used. with a ring of veticals most likely the best. These
are
switched
on and off in turn to have the effect of moving in a circle. that causes a
doppler
shift
which is processed to get a heading. An other method is to use a beam and a
map
peak the signal and draw a line on a map, then move and do it again. x marks
the
spot.
a loop is also used with a dip in signal strenth(null) and draw a line on
the map,
move and
do it a second time and x marks the spot.the "fox chasers" have other
methods most
likely
but I think these are just improvements.

Pete, here is an internet site in Florida which you could check for more information:

http://home1.gte.net/scout/aprs.htm

It is the Florida APRS Users Group site. Basically, if you have the equipment to do regular packet at home, you can do APRS. You just need one of the APRS programs, which are available for DOS, Windows, and Mac. I think there should be a link on this site to a Java APRS page, which will give you a look at where APRS stations are all over the US. If there isn't one there, then try:

http://www.aprs.net/usa1.html

Good luck.

From: kf4sir@localhost.localdomain
Message-ID: <slrn74rccp.ki.kf4sir@localhost.localdomain>
Source record: 21451

Hi all, I have been trying to figure out how to send
a file using packet on a MFJ 1278B TNC with plane vanilla
terminal software.

Does anybody know how to do this?
I have looked through the manual but have not found
any help.

Would special software be required?

What about sending small .gif and .jpg files
(They are ascii not binary)

Thanks for any help,

Dale

4951. PK-88 trouble

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-14 00:00:00 UTC
From: Jim Finney <jpfin@worldnet.att.net>
Message-ID: <364DE13C.1128DECF@worldnet.att.net>
Source record: 21452

Hello,

When I power up my PK-88, the multiconnect light stays light and I am
unable to go to the cmd mode. The unit was working OK until yesterday.
This happened all of the sudden.

Any suggestions on a fix?

Thanks,

Jim

That's usually the autobaud routine (on my unit anyway).
Type a few stars (*) to get it online again.

I use the old Windows 3.1 TERMINAL program with a 1278B. It will send
ASCII and binary files.

The key is whether or not you want error-checking and synchronization
with the receiving end. That requires a kind of hand-shaking that I
think is technically do-able but not practical over most packet systems.

Hi, I can't see any reason why you could not use
a standard ham radio modem (TNC) that supports KISS
mode and use one of the license free UHF radios that
are available.

You would have to make up your own cables and would be limited
to about 1 mile range or so.

Linux on a 486 running TNOS would make a great cheep server.

I hope this helps,

Dale

```
Want: HAL DS-3100ASR Terminal
with or without accessories including
the HAL disk unit.

What do you have?

What condition is it in?

Does it work?

What version of firmware does it have
installed in it (Look at screen on the
'3100 at power-up for the version
number - should probably be 3.x
or 3.xx or some such in the top
left or right hand corner)?

Do you have any manuals for it?

What do you want for it/ them/ the pile
of stuff?

What OTHER HAL stuff do
you have that you'd like to
get rid of?

Where are you located?

Thanks for your time

PK-Term '98 will be available in about 3 weeks. This program, like the popular PacTerm '98 program for Kantronics TNC's, has seperate windows for each connection, so you can monitor your DX cluster all the time. (The beta is running right now, and personally I have it running on the NADXC DX Cluster).

PK-Term '98 is a true Windows 32 bit application for Windows 95, Windows 98 and Windows NT.

It will retail for $69.95.

The cycle time is constant but the number of data bits doubles so it is more critical as far as any distortion on the signal is concerned. Perhaps the AGC has a transmit/receive transit pulse that is distorting the signal somewhat.

From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <72pjfv$qfs@enews2.newsguy.com>
Source record: 21479

Lately I've noticed quite a few ads for juno.com being sent by the local Packet/Internet gateway station, on 2 meters. The ads originate with E-mail from the Internet, not Amateur Packet Radio messages or traffic.

Since the gateway is the first station to transmit these ads, (first transmitting station) , am I correct in assuming that the gateway SYSOP is the Ham responsible for these ads being transmitted on the Ham bands?

The FCC's new enforcement setup is proving to be quite effective, from what I understand. They appear to be both active and responsive.

A word to the wise.

Got interested in packet and the HF "TOR" modes and recently allowed
myself to be talked into ordering a KAM-98. The ads make it look
great, but I am having buyer's remorse in anticipation of receiving
the unit. Anybody had any experiences, good or bad, with this unit?
I intend to operate it on both VHF and HF. Is it a pain to go back
and forth with a single port unit? Should I have gotten the KAM PLUS?
I am really new to this stuff, so any advice would be appreciated.

The KAM will only work with the packet.exe module of WinLink. If you want to use pactor suggest you look at the MSYS program written by WA8BXN which uses the KAM for both VHF and Pactor.

Hi,
I have put in place a small web site dedicated to that amazing new mode,
MT63.

Check it out at:

http://members.xoom.com/ZL1BPU/MT63/MT63.html

There are currently only two MT63 operators in the Southern Hemisphere, and
not many more up under! Please join us - it is simple to get going, and not
very expensive. The same equipment will operate many other modes, including
some exotic ones - PSK31, Feld-Hell and MT-Hell.

73,
Murray ZL1BPU

I think you would be safe to assume 5V p-p AC coupled.

I use small line transformers with good success on several SB cards and their clones, including an SB AWE64. A good trick is to use an old transistor radio output transformer with the speaker side connected to the sound card. That way you get good audio level at the card and comfortable level at the speaker as well.

If you are really concerned, fit a pair of 4.7V zeners in series (reversed) across the line input.

I use the same setup with a Motorola DSP56002EVM, and between it and the sound card run just about every mode going, including Fax, SSTV, MT63, Feld-Hell, MT-Hell and PSK31.

I guess we have to ask ourselves, "How much do we want to pay
in taxes?". That's what it takes to get the FCC rolling. That
is their present agenda --- to do nothing until we get really
pissed off and make a lot of noise. Then we will have:

1. More enforcement.
2. More taxes.
3. More bureauocrats' interference.
4. Less friendliness.

Perhaps the best thing we, as hams, can do is get a "comitee"
to go over to the offenders house and "explain" things to him.

What ever happened to Elmer.

Source record: 21300

No need to freak out :)

I just made the same decision, meaning between a KAM Plus and KAM '98. I purchased the KAM'98 and am quite happy with it. Unless you want to spend the bucks for an SCS or Paccomm Pactor-II unit ($1,000+), it is probably the best thing going in its price range. Kantronics has a good reputation for supporting their 'obsolete' products (within reason). Both units have all the usual Kantronics software goodies, full internal BBS, Ka Node, etc.

One thing I particularly like about the KAM'98 is that all level settings are done in software, no pots to fiddle with - makes it easy to use it with different radios. Just set the level once per radio, and record the level setting for next time. Also handy on HF, makes it easy to maintain the proper ALC levels on each band.

If you have a HF/2-meter combo rig, the single port eliminates some cable swapping. 'Going back and forth' between HF and VHF configurations is very easy. The single port design is not so good if you really need or want a dual-port unit, of course, but this wasn't important to me.

On-the-air performance seems fine, probably not as good as the pure DSP-based units of course, but then again you are paying less than half as much. For keyboard-to-keyboard use PACTOR or G-TOR is fine. Once you get your feet wet you can upgrade to Pactor II if you feel it is worth the expense to you. You will find most activity seems to be on Pactor I and RTTY.

Lastly, I called Kantronics and asked one of their tech support people exactly what the differences were between the KAM Plus and the KAM'98, beyond the stuff listed on the web. They said that the KAM'98 had a considerably faster processor, and was designed to support future efforts (which they either could not or would not disclose, not that I would really expect them to). They indicated that they would continue to support the KAM PLus as much as possible, but that it would be likely that in the future there would be upgrades that were only supported on the KAM'98, because of the processor difference. But in the short term, there really isn't much difference between the two for the $100 difference in price. But I decided to go with the '98...

To sum it up, the Kantronics units are not cutting-edge, state-of-the-art stuff like the Pactor II/Clover DSP systems, but they support all the common modes, plus G-TOR, and have a lot of neat bells and whistles besides. The higher-end units do perform better, but they are expensive and based on proprietary hardware and software, so watch out there. It all depends on what your needs and budget dictates, but in my opionion I didn't go wrong the the KAM...

Hope this helps...

- Seth N6BMB

From: coherent69@my-dejanews.com
Message-ID: <72t9ertvk1@nnrp1.dejanews.com>
Source record: 21301

I just got my MFJ 1278B with the Windows version of their Multicomm software.
I can not get it to decode any FAX, WEFAX, RITTY or CW.

I have a strong 59 on 8040 for the fax. ALL I get are balck and white pixals
no clear fax and on SSTV I get colored pixs but nothing that is coherent.

I have the MFj-1278B hooked up to my Yaesu FT-847 and then to a 200MhZ pentium
with 64 megs ram.

I am using the MFJ packet cable that plugs in the mic Din and then into the
audio out on the back of the rig. (I do not have the mini din packet cable
for the back of the rig! I could use help in finding one or making one)

Can anyone help me out?

You may reply to: bret@baj.com as well.

Thanks..

Bret

Hello.

I am going to set up my sound card to do packet with flexnet. I've done all tests and it seems to be working fine with my old rig YAESU 223-R VHF.

I also have a MFJ-8621 PACKET ONLY DATA RADIO. The Instruction Manual says the following:

"Your MFJ-8621 is designed to work with TNCs that are DCD equipped. If your TNC does not have data carrier detect circuitry, it will read the MFJ-821's unsquelched audio as an incoming signal and will not allow the radio to transmit.."

As the sound card is doing the job of a TNC or modem, I don't know if it is DCD equipped.

Can anyone give a hand..?

From: chelms@occ-uky.campuscw.net
Message-ID: <3652dad2.2701925@news.campuscw.net>
Source record: 21308

Seth,

Thank you SO much for the feedback. Your reponse was right on point
and has greatly alleviated my insecurities. My rig is an IC756
which, of course, does not have VHF. I have a W32 HT with a docking
booster which I suspect can be made to work with the KAM-98 for packet
with some cable swapping and fiddling on the KAM-98. There aren't
many people using packet in my area anyway, so it may be a one time
setup to see if it works, but I want to be able to do it just in case.

I strongly considered getting an SCS Pactor II unit but their stuff
doesn't seem to support all of the other modes which the Kantronics
units do, and as you observed they are pricey. I called Kantronics to
see if there was any plan in the future to support Pactor II on the
KAM-98 or other units and the answer was an unequivocal NO. Sounds
like a licensing problem to me. The lady I talked do did say,
however, that the power of the KAM-98 processor and ease of firmware
upgrades gave the KAM-98 great potential for other enhancements and
they are working on same as we speak. Maybe there really is a tooth
fairy.

Yeah, I don't know what's going on there, my guess would be that SCS wanted too much (at least in Kantronics' opinion) to license Pactor II, or there were some other terms in the licensing agreement that Kantronics objected to. That is always the issue with proprietary protocols designed by smaller companies, they are often quite good from a technical standpoint, but usually either one of two things happens: 1) The mode really takes off and because of the popularity the vendor can name their price for licensing arrangements, or 2) The mode gets good write ups but doesn't become a huge commercial success. Then you are dependent on the livelihood of a single company for support. Guess which happens most often...

But Pactor II has seemed to gain more acceptance than Clover, at least most of the WinLink BBS systems seem to use the SCS box and support Pactor II. Kantronics' strategy seems to be positioning G-TOR as an 'almost as good', but much lower cost, alternative to the PSK modes. Certainly the PSK modes offer better performance, but this doesn't always determine commercial success, there are a lot of other factors there. Will be interesting to see what happens over the next few years...

There's a third possibility: PACTOR-II may be such a pig to implement
that it's not cost-effective for another vendor to develop a
platform. I have seen no evidence that the PTC-II is a superior
performer on RTTY, so contesters and DXers wouldn't be interested in
spending the extra money. I suspect you're right about GTOR, but it's
not taking off, either, apparently.

The soundcard implementations seem to be the right way to go, but
there are compatibility issues with laptops that seem a problem.

Actually, the SCS PTCII does all the modes that the KAM98/KAM Plus does (with the exception of GTOR, which is Kantronics own propriatary mode that very few people use, unfortunately) and more. For example, the PTC II does PACTOR I, PACTOR II, CW, RTTY, AMTOR, NAVTEX, WeFax (no messing about with cables or setting weird modes!) and SSTV. You do have to buy a separate Packet modem if you want to use packet, but then you get the choice of a fast UHF modem, or a regular VHF/HF modem.

> fairy.

They're working on a PACTOR II-like protocol. Whether it will be successful is something we'll have to wait to find out. GTOR never caught on, and it's been around for several years (four, maybe?). PACTOR II is doing excellent business on the Ham bands, and on the marine bands where it is used for Ham <-> Internet gateways and for commercial services like Globe Wireless. I bought a PTC II to demonstrate in class and fell in love with it. During one demonstration, we were showing how an SGC-230 antenna tuner works. The tuner was connected to my TS-850s and to a lightbulb (as the antenna). After whistling into the mic to tune the lightbulb, I suddenly noticed that the PTCII was copying a PACTOR II signal... off the light bulb antenna, *inside* the Long Beach branch of West Marine! I had the volume control of the rig turned up, and all I could hear was static!

The KAM is great and I have several Kantronics units, but the PTC II is *definitely* worth a look if you want to start specializing in digital modes.

Thank's all for all that info, was really interesting.

Someone asked if there are any stations active and I am.
I'm using a Net/Mac station on 29.250 FM 1200 bds and so
far I've only heard lots of regular ax.25 traffic...
(didn't expect anything else anyway)

I know about the limitations of running TCP/IP on HF but
I'd like to try it out...and perhaps learn something.
If anyone wants to try TCP/IP on HF then please mail me !

Globe Wireless uses Clover 400 which is a narrow band implementation of Hal's Clover. The Amateur radio version of Clover will not work on Globe Wireless as it is apparently uses a wider bandwidth.

Pinoak uses Pactor II

What? When did Globe Wireless switch to PACTOR II?
They worked with HAL in the development of Clover 400
and Clover 2000 which are what they have been using on
the NB and WB marine channels.

Many - many years ago, when RTTY just got started, I was tuned into a commercial station and while moving things around in my shack, the antenna wire fell out of the receiver. The telex machine continued printer flawlessly with no antenna attached to the receiver at all. And I couldn't hear any signal either. I guess, ones and zeros really do work better. From: djaffe@my-dejanews.com
Message-ID: <7335bn$vr9$1@nnrp1.dejanews.com>
Source record: 21324

I'm also a newbie digital (actually a pre-newbie, considering my first purchase). So if G-TOR is not used much, then I'd be getting the KAM for RTTY, packet, AMTOR and CW, right? Seems my pentium-based computer could handle these modes. For me, the main argument *against* using my computer is that I find my computer hardware/software are always changing, whereas my ham gear is relatively stable. (That's why, for example the idea of a PC-based tranceiver doesn't attract me.) On the other hand, it's hard to justify spending $400 just to avoid some futzing around every time I upgrade my hardware/software.

So, I suppose, the question is: what do you get (besides G-TOR) with the KAM- 98 (or KAM-plus) that you don't get with some sound card-based software package (while I'm at it, I'd also like to know if there's a consensus as to which package is best?) By the way I have an entire box of sound cards in my basement, as I work as a digital audio/DSP programmer, so that's not an issue for me (I currently have an AWE64 installed.)

I was also sorry to learn that the KAM 98 doesn't support 9600 packet. I wonder if this is more of a marketing decision than anything else, i.e. they don't want to pull sales away from their 9600 baud unit?

I realize I've asked a lot of questions here.
Thanks for any help.

: Basically, if you have the
: equipment to do regular packet at home, you can do APRS.

Basically, true, if you are talking just a base station. However, if you want to run mobile and send out your location to the other APRS stations out there, you also need a GPS receiver. For a mobile unit, you don't need the computer, just the radio, TNC, and GPS. For at the base station, you need the computer to display the locations of other APRS stations via one of the many APRS software packages out there, a TNC, and a radio. National frequency is 144.39 MHz.

John,

I use my HP 620LX for packet once in a while. You don't need any software for this, all you need is already on the 620. You just need the cable and a modem adapter to connect to the TNC and go. I can either e-mail you or post here if others are interested and explain the steps I used to do this.

You are correct. I got the KAM-98 unit today and the manual very clearly states that the KAM-98 can be controlled with terminal communications programs including the DOS one included with the unit, the Pacterm'98 program, or the terminal programs included with Windows 3.1 and Windows 95/98/NT. In point of fact, except for setup and keyboard to keyboard contacts, the computer does not even need to be connected to the KAM-98 unit when it is in the other modes of operation like digipeater and mailbox. I haven't opened the Pacterm 98 box yet, but it will be interesting to see what their $70 software does that a plain-jane terminal package won't. Stay tuned.

Ref the Kam +. In my experience with this, proprietary software is
not required. Any good term program that matches the computer
platform works well with this TNC. I/E on my Commodore128 I use
"Dialogue" which has a huge buffer capability and will drive the
kam+ with no problems. If used on an IBM setup, then something
like Procomm plus would be ideal since using a good term program
offers many extras in the way of options available for the TNC.

The TCM3105 's are available from JDR Micro www.jdr.com
The data sheet can be downloaded from:
http://www.best.com/~wdunckel/electronics.html

There is also a MIM module that uses a PIC to transmit APRS data. Check it out in the ham links at the above sight. It is the size of two quarters!

Does anyone use a 'software only' approach with the TEKK data radios at 9600/
19.2Kbaud? The output of these guys is already digital, right, so that would
take one step out of the process, I'd think. I don't really mind a DOS program,
since I have lots of computers anyway.

Demetre,

I have not done so personally. As I understand the problem,
the Baycom modems are not full TNCs. They do not have internal
microprocessors. They require full time software support from the
PC's processor running a special program.
This is just a suggestion, as I do not know of any one who has
tried it. Perhaps you could run the required DOS program under the
commercial-ware DOS emulator for Windows CE-2? I have no solid idea
whether the emulator would run fast enough to service the Baycom.

The Baycom modes use the DTR and CTS lines for HDLC data, you'd need a WinCe device driver that could handle that, and interface to a Windows CE based program for display of the data.

Quite a bit of work...

You get quite a bit besides G-TOR (which does work quite well - clearly much superior to Pactor I - maybe it will still take of one of these days...), but the value vs. a soundcard solution is up to you. The KAM has a complete internal mailbox, can act as a Ka-Node, can be remotely controlled and programmed, is relatively easy to use, and, of course, can run without a computer. But then again you may not use all or any of these features, depending on what you have in mind... I believe you can add a 9600-baud modem externally, if you desire.

If you are not sure whether you want to make the investment in digital and are just sniffing around then the soundcard option may be better for you, since there is a minimal to no investment required. If you decide to really get into it, you will probably eventually want a dedicated box from one manufacturer or another...

You're correct to assume you can do anything with the PC and sound card
that you can do with the KAM except GTOR. And in most cases you can do
it better. The only fly in the ointment is that most of the available programs
are written for DOS, and won't work correctly in a multitasking environment.
Thus you have to surrender the entire machine to the application. With the
KAM, any serial communications application can talk to it while still allowing
you to use the computer for other things.

Now there's no intrinsic reason why this should be so. And you seem to
have the expertise to write your own programs, so here is a golden opportunity
for you to make a contribution to amateur radio digital operation. :-)

The TEKK radios are really analog FM radios which have been optimized to
pass data modem tones at relatively high baud. You could direct FSK them
with data, but it wouldn't be compatible with the G3RUH modems out there.
It would "work", but only with another TEKK set up the same way. On the
receive side, you'd need to add a slicer externally. That's just an opamp so
it's no biggie. Performance is better, however, if you use data modems
with them. Now you can generate that data modem with a sound card
and software on the PC, so in that sense you can do a software only
approach, but the radios aren't directly digital.

Howdy,

We are investigating an upgrade or outright replacement of the paging system we use to call out our ARES unit. I have read the Kantronics literature, and this seems an option. Have you or someone you know set this particular system up and could you share some insights? We could continue using the Pageboy II pagers on our local repeater, but I can't find any. Perhaps I could get a tip here as well.

Thanks for your consideration,

Max, KK7HI

if you have two radios and two tnc's and two computers, you could set up a 'mini-network'. In which one TNC connects to the other and the other runs something like the MSYS BBS.

Also might have a third radio to monitor the packets, which the general public may oooh and ahhh at . :)

Max,

We're doing some development with Kantronics on Paging server software and using off the shelf componets (I.e. an MFJ Data radio, 2 meter ringo ranger, the 9612 and a modified Motorola bravo pager) it works like a champ, and the cost is under $500.

It's a pretty nice setup for a low cost.

5051. Can someone please help with problem on my KPC4>

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-22 00:00:00 UTC
From: John@datasafe.demon.co.uk
Message-ID: <36589482.3816665@news.demon.co.uk>
Source record: 21253

I have a problem with my KPC4 as follows:

After a while of operation the KPC4 seems to just stop receiving. If I
then switch off and on the problem clears until it occurs again!

Any ideas

Regards

John

I'm not sure what you mean by "terminal control", so I hope I'm not off the mark with this response.

I have a 1278B. I use the Windows TERMINAL.EXE program for RTTY, PACTOR and Packet, and I like the simplicity of it. YAPP is also good for Packet. I'm not sure where to get YAPP now, but it's probably still downloadable from ham radio FTP sites like Oakland.

Try XPKAM by Gary Johnson. It does cost to register but can download for free and run 100 times before registeration. Works all the modes that the KAM can work. Pactor/Amtor/Gtor/Wefax/Packet ect. I don't have the web location off the top of my head but do a search on XPKAM. You will like it.

As I mentioned once before, You can use any good terminal program to
drive kam+ TNC. The software depends on the computer platform your
using. If using CBM then Dialogue 128 or Desterm will work fine
with the kam+. If using IBM platform then Procomm Plus would be
great. If your using MAC then you would need a software term
program that runs on the MAC or IMAC. The "*" used to set the
cmds is what does the trick.

5061. TPRS Fall digital symposium - Dec 12th

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-23 00:00:00 UTC
From: Tom McDermott <mcdermot@NOSPAM.aud.alcatel.com>
Message-ID: <3659BE26.F8F3E37@NOSPAM.aud.alcatel.com>
Source record: 21263
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

The Texas Packet Radio society will be holding the 1998 Fall Digital
Symposium
on Saturday, December 12th, 1998 at The University of Texas, Austin. It
will
be in room 240, Sanchez education building starting at 8:30 AM.
Details, maps,
etc. can be found on our web site: http://www.tprs.org This year,
there will be
4 sessions. There will be a tutorial session on 'LINUX and networking'.
Also,
demonstration of LINUX on an IDE-compatible FLASH card (boots
really fast). There will be a report on the TAPR FHSS radio - there is
a
TCP/IP stack operational on the radio itself.

--------- Agenda ----------

Friday night, Dec 11th 7:00 PM+ Dinner at Sholz Garden, Austin

Saturday, December 12th UT Austin, Room # TBD

Session I. Tutorials 8:30 - 9:30 AM
A. Linux systems -Stu Green
* Setting up Linux as a gateway router.
* How to setup routing tables, default routes, etc.
- Static vs. dynamic addresses, class-c addresses, etc.
* Tunnels - what they do, how to set one up.
* Proxies / IP address masquerading
* Slip and PPP on serial interfaces
* Ethernet interfaces

Session II. Project Reports 9:45 - 12:00
A. FlashCard OS Project - John Koster, W9DDD
B. FHSS radio project status - Tom McDermott, N5EG
C. TexNet - APRS capability, AX.25 tunneling - Bob Morgan, WB5AOH
D. ISP interconnection project - Joe Borovetz, WA5VMS

Lunch 12:00 - 1:30

Session III. Operational Issues 1:30 - 3:00
A. BBS, DXC - David Wolf, WO5H
B. APRS - Mike Heskett, WB5QLD

Session IV. White Paper brainstorm session 3:15 - 5:00
Greg Jones, WD5IVD - discussion leader
Purpose is to define a white paper that can be used as a guide to advise

people
how to safely setup a gateway including routing, maintenance, and
administration
for IP interconnection arrangements. The interconnection arrangements
that this
paper should cover include:

- AX25IP tunneling
- Spread spectrum radio interconnection to an ISP
- Straight and Masqueraded addressing
- Dynamic and Static addressing
- VPN (Virtual Private Networking) for closed tunnel groups

5062. Re: science fair projects?

If you have two full setups and a GPS, if you have someone willing to drive around with the tracker side (if there isn't any APRS activity in your area) then you might want to set up and show how APRS works. You could include a writeup how it helps with SAR work, emergency services, stuff like that. Downside is this would need an antenna capable of picking up the APRS transmissions from outside, which might be a problem. Otherwise, an RBBS setup might be useful, or WEFAX if you've got the capability.

One other possibility that might be do-able is to track and log MIR packet exchanges at home, then create and have a display for this.

5063. Re: WinCE & Packet Radio. Any software?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-23 00:00:00 UTC
From: bblohm@boi.hp.com
Message-ID: <73cftu$p0u14@hpbs1500.boi.hp.com>
Source record: 21265

I've had a couple requests, so I'm posting the instructions here
that worked for me. For clarification, JIC: HP 620LX and KPC-3+
is what I use. I don't see any reason this shouldn't work with
other TNCs (except the Baycoms of course). (Famous last words,
eh? ;-)

Here's the setup I use.

It works. I'm assuming that you have the same standard stuff
I do and that that's common to all WinCE. Here's how I did it.

Start-Programs-Communication-Terminal
Make a New Session
Session Name: Packet TNC
Select a Modem: Go with the Hayes Compatible on COM1
Country, Area, Telephone number, enter what you want
we have to enter something here, but won't use it
Force long distance & Force local both unchecked
Configure (under modem):
Port Settings:
Select Manual Dial (user supplies dial strings)
Terminals: select Use terminal window after dialing
I left the Use terminal window before unchecked
Connection Preferences: all default except baud: 4800
Call Options:
I elected to cancel call if not connected within 120 seconds
Uncheck Wait for dial tone before dialing (default is checked)
Dialing Properties:
Nothing changed under here, all default settings OK

That's it, those are my settings. I have a 9-pin male to 25 pin male
modem connector on the end of the cable that connects my HP 620LX to
my PC and use that to connect to my Kantronics KPC-3+ TNC. Works like
a charm so far. Not as fancy as KA-Gold, for example, but every bit
as functional as any other terminal program. And weighs less than
lugging the laptop around when hiking!

I had dl'd vxHpc and set it up as well, just to try it out. I don't
see any point myself in keeping this and paying $30 when the WinCE
terminal program works just as well. Personal opinion, of course.

Hope this helps you out.

Two suggestions first, then some comments.

Check around in your area and find out what the most common
TNC seems to be. That way, you'll have some local hams with
the same setup to ask questions of. Second, read up on the
various Packet capabilities and then get the model of TNC
that will let you do all the things you want to get into.

Myself, I've used the KPC-3 until it was stolen (well, they
stole the truck and the TNC was in it). Since then I've gone
and gotten two KPC-3 Plus TNCs. I like this unit because I'm
familiar with it and it hasn't let me down yet. Also, it's
small and easily portable, running for several hours off a 9
volt transistor battery that you add. You can also run it off
the wall with most adapters readily available. I use mine
for packet and APRS, but only one mode at a time. Other units
would allow you to run both at once, I think (KAM Plus?).
Look around, see what's used where you are, decide what you
want to use it for, and how you want to use it (base, mobile,
backpacking?) then go for it.

Source record: 21271
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Don't wate your time with TPRS's digital symposium... It's is rip-off, run by folks who intend to destroy, not build the packet radio network.

These morons actually plan to shut down working packet radio networking, and replace those nodes with Internet connections.

TPRS, (Texas Packet Radio Society) has recently come out of the closet as a Non-Ham organization. According to the TexNet network manager, N0CCW, only the name has anything to do with Amateur Packet Radio. TPRS is not, in fact, an Amateur Radio organization no matter what it's name may imply.

It's ironic but true that if you want to support Amateur Packet Radio in Texas, The "Texas Packet Radio Society" is the very last place you should consider sending your money. They are not interested in building an Amateur Packet Radio network at all.

Take a look at the May '98 issue of TPRS's "Q-Report" to see what I mean.. No mention of packet radio, except how it's somehow just not good enough.. The bulk of the newsletter is dedicated to the "great challenge" of abandoning Amateur Radio so that all of TexNet's nodes can be linked to each other by the Internet instead. - Along with an implication that in the near future, TexNet nodes without good *Internet* connections will be phased out of the network altogether. I know that many of the TexNet node-ops are real Hams, and these appear to be the ones TPRS intends to edge out.

What kind of an organization would deliberately plan on edging out Hams using
Radios in favor of "digital communications hobbyists" using The Internet, or "wirelines" donated for the purpose by commercial communications outfits? Why TPRS, of course. - The worst enemy of Amateur Packet Radio in Texas, and the best friend of the commercial communications outfits who would love to grab up our spectrum.

When irresponsible "digital communications hobbyists" go out of their way to undercut our use of Radio by Hams, imposing instead an unseemly dependence upon Non-Ham means of communication, they leave all Hams wide open to attack by commercial communications outfits who covet our bit of spectrum. " Why do they need (Insert Band here) if they prefer to use the Internet anyway? " -- A very good question!

Why, I wonder, is the "Texas Packet Radio Society" so cozy with commercial communications outfits, constantly pushing Non-Ham means of communication while distancing themselves further and even further from Amateur Radio and their fellow Hams?

That's not the kind of people I would care to be associated with. I'd rather work with Hams. - Real Hams who want to see Amateur Packet Radio advance and grow.
A few members of the isolated, insulated little clique that has controlled TPRS since it started are of a mighty high opinion of themselves.. They appear to believe that if THEY cannot figure out how to surmount a problem, then of course nobody else ever will or could either, and that the best policy for all Hams is to "be realistic" and give up on Amateur Radio right now, in an organized fashion.

In fact, most of the innovation and industry recently associated with the Texas Packet Radio Society appears to have been in that very direction; Leading Hams to abandon Amateur Packet Radio networking in favor of Non-Ham means of communication.
N0CCW was giving us the straight scoop when he said that TPRS is not an Amateur Packet Radio organization. It appears to be the exact opposite.

This is why roughly half (over 1000 miles) of the current Texas TexNet "Packet Radio Network" is actually donated wireline links. They claim to be the biggest Amateur Packet Radio network... Well, remove the 1000 miles+ of Non-Ham links and all of a sudden they are running a distant fourth place. Still impressive, but not for long if TPRS's newsletter can be believed. They appear to be ready to deliberately phase out the use of Amateur Packet Radio soon, so that TexNet will no longer be an Amateur Packet Radio network at all. -- And they look forward to that as "progress" ?? ! ??

I guess it may be "progress" for the isolated/insulated TPRS clique, but it sure isn't good news for Hams, whether they live in Texas or not.

When "Digital Communications Hobbyists" (Packet Hackers) route Amateur Packet Radio network traffic over the Internet, they directly undercut the essential reason for allowing Amateur Radio operators the stewardship of our bit of spectrum in the first place.
They cut the throats of all of their fellow hams in the eyes of Congress.

Additionally, simulated "packet radio networking" using Non-Ham means of communication only serves to displace and replace genuine Amateur Radio networking efforts. - It edges out the Hams.
The president of TPRS, Tom McDermott N5EG, does not appear to be content with the speed at which Hams are being edged out of the packet net in the U.S., and is doing what he can to accelerate the process.
What a guy.

When the Hams in Texas decide they would like to initiate a new, REAL "Texas Packet Radio Society", which clearly states in it's charter that the organization is dedicated solely to advancing Amateur Packet Radio, I will be glad to participate.

TPRS's charter does not call for dedication to Amateur Packet Radio. It is a "digital communications hobbyist" organization instead, which explains why TPRS has had no problem in turning against Texas hams, working to destroy
Amateur Packet Radio networking in Texas, and replace it with an utter

dependence upon Non-Ham means of communication. (Internet, Wirelines, ect..)

I have too much personal pride as a ham to associate myself with a Non-Ham organization like TPRS, or the "Non-Hams" who run it. When I want to use the Internet, I dial up my ISP. When I want to utilize Amateur Packet Radio, I use radios. I will not associate myself with persons who cannot comprehend that simple distinction, and who show no respect for Amateur Radio and their fellow hams.

I am a Ham Radio Operator, and not a "digital communications hobbyist", so it
would be a waste of my time (not to mention the slur on my character) if I were to participate in the activities of TPRS.

If "digital communications hobbyists" are starting to take over YOUR Amateur Packet Radio organization, take a hint from the state of Texas, and weed them out right now. You'll be glad you did, and you'll be sorry if you don't.

Thanks for taking the time to look and think this over.

Don't waste your time with TPRS's digital symposium... It's is rip-off, run by folks who intend to destroy, not build the packet radio network.

These clowns actually plan to shut down existing packet radio networking, and
replace those nodes with Internet connections.

TPRS, (Texas Packet Radio Society) recently came out of the closet as a Non-Ham organization. According to the TexNet network manager, N0CCW, only the name has anything to do with Amateur Packet Radio. TPRS is not, in fact, an Amateur Radio organization no matter what it's name may imply.

It's ironic but true that if you want to support Amateur Packet Radio in Texas, The "Texas Packet Radio Society" is the very last place you should consider sending your money. They are not interested in building an Amateur Packet Radio network at all.

Take a look at the May '98 issue of TPRS's "Q-Report" to see what I mean.. No mention of packet radio, except how it's somehow just not good enough.. The bulk of the newsletter is dedicated to the "great challenge" of abandoning Amateur Radio so that all of TexNet's nodes can be linked to each other by the Internet instead. - Along with an implication that in the near future, TexNet nodes without good *Internet* connections will be phased out of the network altogether. I know that many of the TexNet node-ops are real Hams, and these appear to be the ones TPRS intends to edge out.

What kind of an organization would deliberately plan on edging out Hams using Radios in favor of "digital communications hobbyists" using The Internet, or
"wirelines" donated for the purpose by commercial communications outfits? Why TPRS, of course. - The worst enemy of Amateur Packet Radio in Texas, and the best friend of the commercial communications outfits who would love to grab up our spectrum.

When irresponsible "digital communications hobbyists" go out of their way to undercut our use of Radio by Hams, imposing instead an unseemly dependence upon Non-Ham means of communication, they leave all Hams wide open to attack by commercial communications outfits who covet our bit of spectrum. " Why do they need (Insert Band here) if they prefer to use the Internet anyway? " -- A very good question!

Why, I wonder, is the "Texas Packet Radio Society" so cozy with commercial communications outfits, constantly pushing Non-Ham means of communication while distancing themselves further and even further from Amateur Radio and

their fellow Hams?

That's not the kind of people I would care to be associated with. I'd rather work with Hams. - Real Hams who want to see Amateur Packet Radio advance and grow.
A few members of the isolated, insulated little clique that has controlled TPRS since it started are of a mighty high opinion of themselves.. They appear to believe that if THEY cannot figure out how to surmount a problem, then of course nobody else ever will or could either, and that the best policy for all Hams is to "be realistic" and give up on Amateur Radio right now, in an organized fashion.

In fact, most of the innovation and industry recently associated with the Texas Packet Radio Society appears to have been in that very direction; Leading Hams to abandon Amateur Packet Radio networking in favor of Non-Ham means of communication.
N0CCW was giving us the straight scoop when he said that TPRS is not an Amateur Packet Radio organization. It appears to be the exact opposite.

This is why roughly half (over 1000 miles) of the current Texas TexNet "Packet Radio Network" is actually donated wireline links. They claim to be the biggest Amateur Packet Radio network... Well, remove the 1000 miles+ of Non-Ham links and all of a sudden they are running a distant fourth place. Still impressive, but not for long if TPRS's newsletter can be believed. They appear to be ready to deliberately phase out the use of Amateur Packet Radio soon, so that TexNet will no longer be an Amateur Packet Radio network at all. -- And they look forward to that as "progress" ?? ! ??

I guess it may be "progress" for the isolated/insulated TPRS clique, but it sure isn't good news for Hams, whether they live in Texas or not.

When "Digital Communications Hobbyists" (Packet Hackers) route Amateur Packet Radio network traffic over the Internet, they directly undercut the essential reason for allowing Amateur Radio operators the stewardship of our bit of spectrum in the first place.
They cut the throats of all of their fellow hams in the eyes of Congress.

Additionally, simulated "packet radio networking" using Non-Ham means of communication only serves to displace and replace genuine Amateur Radio networking efforts. - It edges out the Hams.
The president of TPRS, Tom McDermott N5EG, does not appear to be content with the speed at which Hams are being edged out of the packet net in the U.S., and is doing what he can to accelerate the process.
What a guy.

When the Hams in Texas decide they would like to initiate a new, REAL "Texas Packet Radio Society", which clearly states in it's charter that the organization is dedicated solely to advancing Amateur Packet Radio, I will be glad to participate.

TPRS's charter does not call for dedication to Amateur Packet Radio. It is a "digital communications hobbyist" organization instead, which explains why TPRS has had no problem in turning against Texas hams, working to

destroy
Amateur Packet Radio networking in Texas, and replace it with an utter dependence upon Non-Ham means of communication. (Internet, Wirelines, ect..)

I have too much personal pride as a ham to associate myself with a Non-Ham organization like TPRS, or the "Non-Hams" who run it. When I want to use the Internet, I dial up my ISP. When I want to utilize Amateur Packet Radio, I use radios. I will not associate myself with persons who cannot comprehend that simple distinction, and who show no respect for Amateur Radio and their fellow hams.

I am a Ham Radio Operator, and not a "digital communications hobbyist", so it would be a waste of my time (not to mention the slur on my character) if I were to participate in the activities of TPRS.

If "digital communications hobbyists" are starting to take over YOUR Amateur Packet Radio organization, take a hint from the state of Texas, and weed them out right now. You'll be glad you did, and you'll be sorry if you don't.

Thanks for taking the time to look and think this over.

Normally I would most heartily agree with your assessment Steve, but you must understand that when TPRS "says otherwise" to Hams using radio, they affect a lot of Hams who might have mistakenly thought that TPRS was an Amateur Radio organization. The name "Texas Packet Radio Society" is misleading in that respect.

I wouldn't call the TPRS guys "sniveling pecker-puffers" when "LandLine Lids" is much more accurate and to the point. I have left Greg Jones completely out of this discussion, and there's no need to bring him into it now. Although Greg still has a cadre of butt-kissers within TPRS, he is no longer an officer of that organization and hasn't been for several years.

Hams end up supporting TPRS, giving them their hard-earned cash, not knowing that TPRS will take their money and use it to work *against* Amateur Packet Radio networking, not for it as thier name implies.

Just setting the record straight, OM.

Your lack of knowlege is sticking out, Steve.. Better tuck it in, old boy, and zip it up.

(Or at the very least, check your facts. I haven't worked with the LandLine Lid organizations in the last few years, but it's a big planet. Lots of legitimate Ham organizations to work with, and no need to "rub elbows" with geeky lids in order to participate in them. I've been active, but only with legitimate Ham organizations.)

Yes, that's exactly what I have done, and it's worked out pretty well. It's nice working with competent Hams, instead of the geeky Lids infesting TPRS.

in case you just want to try PR without spending and much, and if you
own a PC with a sound card, you already have everything you need.

The flexnet system does the rest for you (besides a tiny interface for
switching the PLL - a transistor, resistor and diode).

Have a look at the flexnet home page:
http://home.pages.de/~flexnet

Keep your rifle clean, merge with the enemy, win.

Doesn't your Command Post do this for you? Or, are you saying
you want to add this capability to the command post?

The cheapest way, would be to requisition a military modem. The
military has some excellent HF modems. If you would like to use
a Ham modem, then check out the Clover. It is the only one with
FEC.

The Ham modems won't be able to interface with the encryption
unit however. Kantronics makes a DES model of the KAM I think,
so that might be a possibility, unless you need higher security, in
which case, you'll have to go all military.

Go to the base library, they might have a copy of Janes Communication
Systems, and it gives a brief description and photo of all communications
products available to the military.

It will work, the only catch is that you will have to use off-line
encryption.. The TNC does not care if the data is encrypted or not, it will
send what ever file is loaded into it (7 or 8 bit).

Operating as a Ham on military frequencies is somewhat less than clever. If
you do not plan on operating as a Ham, then your question has no place on
this newsgroup, which, after all, is dedicated to digital Ham Radio.

So... Maybe you should take your question elsewhere.

The point I was making, was that most military communications have
to take Operational Security into consideration. Whether DES or a
software algorithm is used, may not be a choice. A Commander may
require that all Comms be secure, with military grade encryption.

Military grade usually means hardware based. Stuff that is physically
coded each day.

If the Commander allows a lower grade to send health and welfare
traffic, then so much the better. I suspect they will rather you write
a letter and have the mailbag, rather than an Omni broadcast :-)

Steve

David & Brenda,

Unfortunately, there isn't much freeware that compares to the
commercial or shareware.

I've used a number of programs but for overall use on any platform,
KaGOLD is the one I use most. The Winapps available are nice, but I have
a portable system that can't run Windows, and a 3rd system I use mostly
for ham radio and as a bench-top system with a spectrum analyzer program
running on it. I also run KaGOLD in Windows 98 on my Pentium along with
other programs, so it's truly a "runs anywhere" type program.

If you want "rig control" KaGOLD doesn't support rig control, but aside
from that, it's got a lot of features that others don't have, including
remote command processing, automatic selection of file transfer
protocols, conferencing (and multi-level conferencing). You can run a
separate program for rig control (in windows) -- and you can run
multiple copies of KaGOLD in Windows too.

Interflex used to have a testdrive on their web site but for some
reason, it's not there. Maybe it will be back. Check out
http://www.interflex.com and get the Windows help files, they will tell
you a lot about the program.

Whatever you get, the KAM is a great tnc for the money. But it will do a
lot more with a good program controlling it.

i proposed to kantronics and to hal last spring at dayton that they ought to "swap" gtor for clover and vice-versa so as to make the "american" digital modes the defacto standard on the "american" air waves. in other words, kantronics kams would also have the clover mode and hal boards would have the gtor mode. then we could sit back and watch the thousand dollar plus pactor I/II tnc's die a slow death.

jim,

kagold leaves the tnc in host mode. you have to be in terminal
mode to run the aprs software. a quick way to do this is to do a
Alt-F-3 and enter terminal mode while running kagold. then turn off
the tnc and do a alt-f-10 to exit kagold. when kagold exits, turn the
tnc back on and load up the aprs software. make sure you have mon on.
give me a call. i have tried to call you but no answer and the
answering machine does not come on. 73, bill wb6jar

5094. Problem with HF Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-25 00:00:00 UTC
From: "T.L." <TNC@nospam.net>
Message-ID: <365B9D9E.78A7@nospam.net>
Source record: 21196

Greetings,
I have a slight problem that I would like to share
with the ham radio digital "wizards" ..... :-)

I am currently using Pacterm98 with a KAM98. I have
made lots of contacts in the non-Packet HF modes (i.e.
RTTY/Pactor/Gtor) and the software/hardware combo works
well.

But, when I try HF packet, I can monitor packet activity
without a problem. However, after I link to another
station or someone links to my callsign, after a few frames
are xferred, the KAM98 locks up. The LED goes to the center
like if there was no available signal being detected.
Additionally, if I send a command from the PActerm98 window,
the Kam98 doesn't respond. Only way to recover is to cycle
the KAM98 (i.e. power down -> power back up)

The interesting aspect is that I used Windows95's "Hyperterm"
software, and HF packet worked great. I had a contact with a ham
in MO for over 30 minutes, and the KAM98 worked fine.

Does anyone have an idea what variable I missed in Pacterm98
that would cause this lockup that I am seeing?? I am not planning
to spend time on HF packet, but since this KAM98 and Pacterm98
are both new, I wanted to put it thru it's paces to see if I
could find anything... Unfortunately, I did... :-(

Any comments/suggestions would be appreciated. You can send
them to my address: kj5xf@worldnet.att.net

Thanks,
Tony L.

You know, it does look like the Linux kernels at 2.1 or better have support for doing 9600 g3ruh with sound blaster cards. So, gawd, maybe it looks like it's possible to do the TEKK radio + PC solution for 9600 baud packet. I feel like I should get two of the things just so I can set it up talking to myself. Hmm.

Impossible to run Clover in a KAM. They probably were just being
polite in listening to you. For reference, check out the huge DSP chip
in the Clover, and then look at the lack of said DSP in the KAM.

Now if you're talking about a whole new product, then yes.

I think you are too fixated on the word "american." If Americans would
train their kids in science and math at comparable levels to overseas
schools, we wouldn't be headed for the third rate import nation we are
striving for.

Tony,

Did you set the HF packet option on the PacTerm '98 communications screen? Under File/Settings on the communications tab, there is an option to set the Kam '98 for VHF or HF packet. If you've done that, then the Kam '98 should be set for HF packet.

I'll also touch base with Kantronics on this too, as it also sounds like it may be a firmware problem in host mode. There is no difference in the way PacTerm '98 does HF packet from VHF packet.

Can you connect ok in the VHF packet mode?

I'll also have my test team try to replicate this today.

You are probably trying to use a *NOS BBS.. Try a real BBS such as RLI, FBB.
MSYS,
ect, if one of these is near you. These have a WP (white pages) server
built-in
which will automagically look up and properly address outgoing messages for
you.-
All you have to provide is the callsign of the Ham you wish to send a
message to. If he's on packet, the WP server will already know his address
90% of the time, and will enter it for you.

It's a no-brainer, but only if your BBS SYSOP uses competent software. Stay
away from *NOS systems, and you will not experience any problems.

Bill, I have a PK232MBX circa 1990 and if AEA was consistent in the Molex connector to radio port, the following pins apply:
1 - Receive audio
2 - Microphone audio
3 - Optional squelch input from radio
4 - Ground/audio and ptt return
5 - PTT

If you're interested I can send you my manual for you to peruse/copy as needed. Plenty of info on commands, which may or may not apply to your soft/firmware. Mine is from July 1990 release.

From: fiz <fiz@wavecom.net>
Message-ID: <73hgm3$c74$1@svr1.gstis.net>
Source record: 21207

Hi,

Does anyone know of an internet server where a person can look up packet email addresses? I want to send a message to a friend via packet, but don't know his exact address.

If such a server doesn't exist, would it be worthwhile? I started such a project with a Web interface at one time, but got busy and didn't finish it. I might look at it again if there's interest. I planned on a simple "callsign / packet address" form for entry / lookup. If you want name, snail mail address, city, etc, there are plenty of callsign servers which will give you this info...

5108. hamradio-online.com: Low Cost Amateur Digital Video is Now a Reality

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-25 00:00:00 UTC
From: vbook@vbook-nospam.com
Message-ID: <73htr8$k23$1@supernews.com>
Source record: 21210
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew

KT4OZ and KB5IHI this week demonstrated the feasability of low cost Amateur Digital Video. Using notebook computers, wireless LAN cards and off the shelf streaming video software, the conducted a two-way wireless digital video link in the 2.4 GHz band. Assuming you already have a computer and camera (which is now common), the total cost of the additional components is minimal.

This technology demonstration shows one path to achieving low cost and widely available digital video in the Amateur bands. Such signals could further be linked via the Internet (since they use standard Internet protocols) to enable connections between distant Amateur TV repeaters. There are many fascinating applications yet to be developed from this technology experiment.

You can read the full story at our non-commercial, no advertising, nothing to see personal web site at http://hamradio-online.com.

Ham Radio.FAQ is a frequently-asked questions file intended to
summarize some of the common questions and help beginning ham
radio operators get started.

If you aren't yet a licensed ham radio operator but are thinking
of getting your "ticket", you are encouraged to explore via this
FAQ and the WWW sites it LINKS to and get a sense of how
t o t a l l y neat amateur radio is. After all,
amateur radio IS the first wireless Internet!

You only stand to GAIN - in technical knowledge, operating
skills, new friendships all over the world, and a sense of pride
and accomplishment in earning your license, assembling, and
operating YOUR very own station.

Please provide the URL the Ham Radio.FAQ to any new or soon-to-be
Hams that you know or create a link from your site to us to help
pass the word.

http://www.mv.com/ipusers/wd1v/hamradio.faq.html

Your suggestions, corrections, ideas, and assistance are
appreciated!

>while deployed in the field. Any ideas guys? Most of our antennas are
>Nevis, Grey4, Inverted V, inverted L. Will these work?

You could use Harris RF-5710 (or similar) and a notebook with suitable
terminal emulator. It's easiest if you've got access to an on-line
encryption
unit then the entire hook-up would be: computer - crypto - modem - radio.
The Harris RF-5710 will key on RTS ("RTS keys xmtr" in the menu) so
use a terminal emulator that's capable of doing that (could send you one
if you need it). If you haven't got an RF-5710 then any STANAG-4285,
4529 or perhaps 5066 compatible modem. If you haven't got that either
well then try Paccomms EWM-modems.
The RF-5710b is capable of 14400 bps (uncoded) and 9600 bps (coded)
in a normal 3 kHz wide HF-channel, that's pretty good.

Hi. I'm trying to help an 11 year old ham get on the air on packet. He has an HT, and I have an old PC I'm giving him to use as a terminal. I need a simple, no-frills TNC. If you have one to sell cheap, or to donate free, please drop me an email. Thanks.

Mike, N4PDY

You can use a soundcard as a TNC. About three bucks worth of parts will
allow you to build a simple PTT interface through a serial port. The
software is free.

At my URL below, push the "FlexNet" button and go from there.

Good luck!

PC-FlexNet works with a regular soundcard. Three bucks worth of parts will
build you a simple PTT interface and the software is free. If you need the
Com port for something else, there are PTT interfaces for the game port,
parallel port, and even a VOX setup which works off of the transmit audio.

Not only will you be fixing him up with an inexpensive TNC, but also one
with better performance than any of the commercially available TNC's in a
box. - Strange but true.

Go to my URL listed below, and push the "FlexNet" button for more info.

Good luck!

Miroslav Skoric YT7MPB wrote to our FCC:

> I would like to suggest a new class of ham licensing. It might be
> the "digital only license".

Two points:

1) Why would anyone aspired to a license which allows only
a single mode? Seems very restrictive.

2) YT7MPB should send suggestions to the authorities in his own
country, not to the United States FCC.

One other thing about Winaprs, is that the INITxxx.tnc files are NOT
in the main directory. Select the file from C:\winaprs\tncs and place
it in the directory with WINAPRS.exe... THe INITxxx.tnc file sets up
the tnc's to a state compatabile for APRS. ALso make sure (if a KAM)
that the tnc isnt in NEWuser or HOST mode as JAR mentioned.

Hello all,

Anyone have an FT-847 they they use on HF Digital modes? I have been unable to get mine to work properly. I have got it to work on VHF/UHF Packet using the Mini Din plug, but when I try to hook up the HF connection to my PK-232, the most I can get it to do is key. I have followed the manuals directions, as well as the manual for the 232, and to no avail.
If anyone knows the proper wiring for this connection, Please let me know...Thanks!

Try making sure the plug in IC's are seatted well. Pull them out and
resocket them to make sure. If any of the pins look "black" from
silver oxide coaring, they will need to be cleaned.

Oh Oh, trouble in Packet City Texas:

Charles Brabham wrote in message <72pjfv$qfs@enews2.newsguy.com>...
>Lately I've noticed quite a few ads for juno.com being sent by the local
>Packet/Internet gateway station, on 2 meters. The ads originate with E-mail
>from the Internet, not Amateur Packet Radio messages or traffic.

Define Advertisement. What is the legal definition? The ARS is based
completely on law statutes (Part 97). The FCC has stated that they will
never prosecute or enforce commercial transactions which interface
Ham radio with commercial establishments (ordering a pizza via the
phone patch, etc).

>The FCC's new enforcement setup is proving to be quite effective, from what
>I understand. They appear to be both active and responsive.

There is no legal enforcement mechanism for email content, that may or not
be an advertisement.

>
>A word to the wise.

You have to show us the wisdom.

OK, let's read between the lines, since the author is really telling us, that he
is disturbed by what appear to be advertisements in people's email. Rather
than say that, he takes on a semantical train ride, and then threatens to
call someone who will fix the problem.

There are two kinds of people that can fix our problem: us and them. Instead
of going to "them" for a solution, the thought process ought to be: "What can
we do to fix the problem?" It is a technical problem, and not a legal one.
The technical solution would be for our packet software to parse the data out,
and as such I intend to do that on my gateway. This is a hobby, so I can't
predict when I will be complete, or even if I ever will be complete.

I think most of us can say without reservation, that the little tag lines
attached
to peoples mail really bugs us. I can't believe anyone would be so cheap as
to get a free email account, or a free web page. They do this even though
all their mail and web pages are ruined by the banners and tag lines. I know
it's popular, but it's one of those things that can't sustain itself. What's
happening here, is that Wal-Mart is wiping out Ma and Pa. That is, the little
ISP can't win, they go away, and Wal-Mart owns the market share. Then
the little email and web pages cost money, and there is no other option.
It's mass suicide, and Americans fall for it every time.

Steve

I wouldn't spend any money just yet.

I checked the Web page for the mobile that they have that
does the same modes (TM-G707A). When you check
the specs it says "Reactance Modulator"

http://www.kenwood.net/products

Beeeep! Wrong answer. Won't do 9600 with that.

Still no reference to the new handheld, but:

www.texastowers.com

Has a reference.

For VHF See:

www.hamtronics.com

They have a new receiver/transmitter boards that have received
great reviews. This is about the only way to go for VHF unless
you find an older Land Mobile radio. The Hamtronics boards use
DIP switches to change frequency, so crystal changing days are
over for their stuff :-)

These boards will do FSK out of the box.

For UHF, you probably can't beat the Tekk in price.

Another thing to try would be to check the voltage regulator ... probably
a 3-terminal thing in a TO-220 package (like an LM7805, LM317, etc.)

If something is pulling too much current, or the heatsinking is inadequate
(like the "tab" is not screwed down where it should be or such), the regulator
will go to into thermal or overcurrent shutdown (built-in self-protection
modes).

Turning the thing off for a bit would allow the regulator to recover, but
it would shut down again soon if the underlying problem were not fixed.

Good luck and 73,

Yes, you can enter two different modes easily. We often transmit on LSB
and receive on CW usisng AFSK tones on AMTOR/PACTOR. As for memory, I can
not say---never did figgure out that riddle! Cliff K7RR

Have you considered something like PROCOMM Plus instead of a
packet driver only?. The Kam Plus works with most any good term
program and offers all the extra features that comes with such
programs. In fact it even will work with other computers such
as Commodore, Amiga, Mac's, etc as long as you use a term program
that was written for those platforms.

MultiMode 1.2.1 has been released. It runs on any PPC MacOS system, and may run on some fast 68040 Macs. A windows version is *not* available.

MultiMode is shareware. The MultiMode web site URL is http://www.blackcatsystems.com/software/multimode.html

MultiMode decodes the following signals:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
WEATHER / SATELLITE FAX
ACARS
WWVB Time Decode
DTMF
Audio Spectrum Display to aid in properly tuning in stations

I was given a "Zerox System 60" (i.e. ancient computer) with a
monochrome monitor recently.
I was about to toss it out when I thought about trying to make a paket
terminal out of it.
I loaded Paket 6.0 s/w on a floppy (no h-d)and hooked-up the tnc(KPC-3).
All is well except all the text flashes constantly. The header is ok,the
footer is ok, everything I type displays ok, but everything the tnc
sends me just flashes. What's going on here?
Everything else on the Zerox (2 other dos-games) works ok.
The Paket 6.0/KPC-3 works fine on my 486-SVGA computer.
Any suggestions??
Thx in adv,73

See if there is a 7 bit ASCII option, the 8th bit is probably
messing it up. Just a guess.

Again, the ARRL folks I talked to say different. "Major violation" was the term used. Of course the final authority would be the FCC themselves.

>The technical solution would be for our packet software to parse the data out,
>and as such I intend to do that on my gateway. This is a hobby, so I can't
>predict when I will be complete, or even if I ever will be complete.

I *did* suggest using software to look for and remove the illegal material, and even explained how to set it up.

That's what I'm doing right now. Illegal tag-lines are automagically Xapped here at N5PVL BBS. Anybody running competent software can set it up very easily.

I don't know about all that, but I do know that Hams like bargains and at times are willing to go to what you or I might consider "ridiculous lengths" to utilize something they see as a "bargain".

For my part, I don't see any reason to settle for a half-way, crippled up deal when I can have full-access for 20 measly bucks a month.

I am looking for a confident E-mail/Packet provider who sees no problem in being a "test case"... If you are truly confident that the FCC will respect your opinion more than PART 97, perhaps you would care to volunteer?

Why bother debating an issue which can be settled so easily and definitively?

Hey Charlie,

Are you a PACKET RADIO LID? Ha ha ha, you must be one if you got angry.
And I wonder are you an English Teacher as well as HAM (bacon etc)?
Well talking about your opinion about perfect grammar, just have a look at
the 3rd line of your sentence. Have they not taught you at school that you
should put an article before the word "result"? You have probably learned
grammar from a COW.

If you do not like Internet Charlie-Boy, then DO NOT USE IT. Simple isn't it?
Well for people who can think is simple not for people like your lot!

Now why attack anyone who says something in this list Charlie? I think there
is something terribly wrong with you! I think you need a psychiatrist!
They are very popular in your area. Why don't you visit one?
If you want to make a REAL PACKET RADIO NETWORK then go ahead and make one.
Do not cry that everyone else tries to stop you. Only mentally ill people
behave like you do! I guess that you cannot understand this Charlie, because
if you could you wouldn't be saying these things to people.

So go ahead and enjoy your hobby before the martians get it and leave this
list and all Internet lists alone for the people who like Internet. If all
you have in life is AX25 packet radio MAIL, then go ahead and use it before
you lose it.

I would also like to remind you Charlie-Boy that except COWS there are
some creatures in this earth called women. Perhaps you should try and meet
one and then you will forget all about PACKET RADIO LIDS (not packet radio
users). This will definately make you see the light Charlie-Boy. Ha ha ha!!
This will definately stop you from DREAMING of Land Line Lids all the time.
You will have other dreams then, wet ones! ha ha ha!!!

If you like to be a DICTATOR Charlie then I am afraid you have chosen the
wrong place.

Regards
.

Quick question for one of you IC-706 owners out there...

When operating in split mode, can you set different modes for each operating frequency? In other words, can you set the radio to receive on, say, 10.132 MHz RTTY, and transmit 2.1 kHz higher on LSB? Also, can you enter this configuration into a memory and have everything retained?

I use this trick with my IC-746 when working digital modes so that I can transmit on LSB AFSK but receive in the RTTY mode in order to take advantage of the narrow RTTY filter. Was wondering if this would work with the 706 as well...

Thanks in advance -

- Seth

Hi all,
I read the FlexNet Page on using soundcard as an interface for
your computer in the ax.25 world. There is a hint that best soundcards are
those that incorporate the AD chip (Analog Devices).

Does anyone of you know of an optimal soundcard to buy? Are you
using any and would like to recommend one?

I know it cannot be a PCI soundcard.

Yes, and easily. Just set VFO A for the TX freq/mode, VFO B for RX. Press
the SPL to put it into split mode, hit tx to verify it really did work,
select your
memory channel, hit MW, and it's there.

I didn't know it would either, but your question got me to try it. Also will
split
across any band/mode it seems. I seem to be learning as time goes by that
this radio will so almost anything. (well, that it is DESIGNED too.

Hello Seth,

I have done something similar to what you describe. But just set up your
exact scenario on my 706MkII and it worked perfectly. It went to memory
without a problem.

Exactly. It's a non-problem. A lawyer could probably get more out
of you for reading peoples mail, then the FCC could get out of a
hobby radio system.

I've been running a gateway for years, and no Ham has ever complained.
Even our local ARRL managers uses it.

It's a non-problem.

Gary,

I tried to email you but it bounced. My question how do you select the antenna output port to use on an AT-500. I know how to do it on my AT-150 with the little switches but cannot find similar switches on the AT-500.

Thanks Jerry

Source record: 21117

hello,

Did you set up the DCE-DTE LINK speed to atleast 56000 and possible
115200 ?

(DCE=modem, DTE=computer)

Seeing 19.4 as the max speed means that your DCE-DTE link speed has been
set
to the default value of 19.2 KB or so.

There doesnt seem to be anything wrong with your ZOOM modem, just set up
the
modem-computer link speed properly.

Murray Green wrote:

Another post from the semi-literate coward, ashamed of his callsign (if he has one) and slamming Amateur Packet Radio. Probably a CB operator trying to have his privileges expanded by doing what he can to turn Amateur Radio into an extension of CB. Hence the lack of basic communication skills.

Get a life, get a callsign, get real - if you can, LandLine Lid. I don't think you're up to it, personally. You've already demonstrated that you are not up to minimum standards as a Ham.

This newsgroup is intended for use by Hams who are interested in the digital aspects of AMATEUR RADIO. It is not intended as a discussion group for Lids who use the Internet to denigrate and "hack" the Amateur Packet Radio network.

Packet Radio is a subset of Amateur Radio, not the other way around. The fact that you either cannot comprehend this fact or choose to ignore it is, by definition, what makes you a LandLine Lid instead of a valuable member of the Amateur Packet Radio community.

If you do not like Amateur Radio and can do without it then by all means do not hesitate to take a hike, LandLine Lid, because Amateur Radio can sure as heck do just fine without you.

5173. HF-VHF Multi Mode TNC - Which One?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-11-30 00:00:00 UTC
From: Jeff Goodspeed <cmsx42@email.mot.com>
Message-ID: <36631210.3835DC1@email.mot.com>
Source record: 21125

Greetings Digital Gurus:

I would like your opinions on which multi-mode HF/VHF TNC to get into digital communications with. Digital COM is one of those items on my Ham Radio to-do list that never made it to the top. Recently, my family heritage of hearing loss has kicked in and using the Digital COM is suddenly more interesting.

Iï¿½m thinking of buying a used unit but have no idea which one to shoot for. I guess there are three primary models to choose from.

KAM-Plusï¿½Kantronics
PK-232MBX/DSPï¿½TimeWave/AEA
MFJ-1278Bï¿½MFJ

I know the KAM-Plus is the only one that has G-TOR, but Iï¿½m not sure thatï¿½s really important. I know the PK-232 has been popular, but I donï¿½t think itï¿½s being sold new anymore and Iï¿½m not sure how long TimeWave will be supporting it. I donï¿½t know anything about the MFJ-1278B but have a prejudice about MFJ in general after seeing More F-ing Junk.

Iï¿½d like to operate HF while being connected to the local VHF Packet DX network. I only have one computer (old 486) and it only has one serial port running on Windows 3.1. I think the Kantronics is the only TNC that can operate both HF and VHF simultaneously. Even so, can it communicate both these links to one computer over one serial port? Is there terminal software to work with this?

I also get the impression that all TNCs arenï¿½t equal. On a given mode, some have much better throughput than others and handle QRN/QRM/QSB better.

Iï¿½ll be asking about integrated software for the Terminal/Station Control/Rotor Control/Logging/Awards/Contesting/Blah- Blah- Blah another time.

> the other two.

The KAM Plus is rarely used with a common terminal program, and definitely not used with a common terminal program if you want to do simultaneous HF and VHF digital modes (eg VHF Packet and PACTOR) as doing this *requires* that the unit be operated in HOST mode. So saying that it is user "unfriendly" is rather moot, as it is the "friendliness" of the software you are using, not the KAM itself that is in question!

> G-Tor : used only once, had to switch to pactor as g-tor didn't work
> (haven't switched back).

I've made *very* few G-TOR contacts myself. It's a mode that just hasn't caught on.

> It does both VHF and UHF at the same time and that's about the only good
> thing about it.

To reiterate, it'll only do VHF and non-packet HF simultaneously in HOST mode, so your aprogram must support HOST mode.

> Tuning indicator sucks.

I can't say I've ever had a problem with the tuning scope on my KAM. If the two end LEDs light up, it's tuned and is copying.

> Will freeze on occasion and needs a cold-boot to start again (seems like a
> common kantronics problem).

I've never experienced that with any of the Kantronics units I've used or set up for clients.

> pk-232: great sensitivity/filtering but only one port at a time.

From what I've heard, it is the PK-232 that locks up for no apparent reason, is particularly user unfriendly and, thankfully, is no longer in

production! ;-)

Too bad Bill found it beyond his capacity to read and follow the docs. It's all spelled out quite plainly, for those of us who can read and follow directions.

Yep, the soundcard driver does use a lot of system resources. Most of us only try to do one thing at a time, particularly when operating packet, so the "load on system resources" is a moot point. If it IS a big problem, why just go ahead and use a BayCom type modem instead, a TNC2 clone, DRSI card, or what have you? Oh, I'm sorry... I guess you'd rather just complain than plug in your brain.

I'm not complaining. I build a Baycom from the A&A kit, plugged it into
my laptop, and played with it a few years back. This is a case where I'd
say $50 worth of hardware is a more elegant solution than doing it with
a sound card.

If I wanted to whine, I'd whine about the lack of interest in packet
locally, but that is a dead end, too.

The more clever English-speaking Hams prefer to try reading the English docs. I read them and was operating in less than two hours. Is it your contention that I am some sort of genius, which I feel is pretty unlikely, or are you trying to make the much more likely point that you are (comparatively) some sort of idiot?

Hmmmm?

Try trolling on another subject. You only manage to point out your own lack of intelligence with your current line of BS.

Many of you may wonder why the sudden rash of trolling against FlexNet, the most sophisticated and effective Packet Radio networking system currently available to Hams.

It's the LandLine Lids. Thus the nasty, anti-Ham sentiments expressed by semi-literate trolls.

It's best to ignore them. They're afraid of the future of Packet Radio and are already choking on the dust of more progressive, forward-looking Hams. Soon they'll be history.

R.I.P. LandLine Lids trolls. You're history. ;-)

Hey folks,

I have started a website and ISP strictly for ham operators. The idea is to get hams to help keep up a website with information updated weekly and monthly. I would like to have all the cool stuff you find on the net in one website. News, mailing lists, callsign database, if its cool I want to put it on there.

I could use someone to keep up a digital portion of the hamsnet site.

I am also offering free e-mail addresses, web services for all ham operators. I am also offering local dial-up service for people in Oklahoma (numbers in Oklahoma City and Stillwater, OK)

Please go check out the site and get your free e-mail account
http://www.hamsnet.net

Thanks for your help

I think you have one of two problems:

1. Since the screen is likely to be CGA, it is probable that any time anything is written to the screen, the screen will flash or blink. The answer is to only write to the screen during retrace. Older software often has an option for this called "snow removal" or "non-snow" mode.

2. It may be that you have an ANSI graphics driver loaded, and that it is either incompatable with, or different to the software you are using, causing some text sequences to flash the text on the screen.

Ask a local PC guru for an opinion. I don't think it is a radio related problem.

Fred

>
>KAM-Plus Kantronics
>PK-232MBX/DSP TimeWave/AEA
>MFJ-1278B MFJ

In my humble opinion..

KAM-Plus is user-UNfriendly and the sensitivity on HF is not as good as
the other two. G-Tor : used only once, had to switch to pactor as g-tor
didn't
work (haven't switched back). It does both VHF and UHF at the same time
and that's about the only good thing about it. Tuning indicator sucks.
Will freeze on occasion and needs a cold-boot to start again (seems like a
common kantronics problem).

pk-232: great sensitivity/filtering but only one port at a time.

mfj-1278: does almost any mode. It's really good on hf but it's not as good
as my other tnc's on vhf. It doesn't do two ports at a time either. Best
tuning
indicator of all these.

So, if you REALLY need to do hf/vhf at the same time: buy a KAM.
If you want a really good multi-mode tnc for hf: mfj-1278.

Why? In order to "ensure" that no-code hams won't make some threats to the
other (say CW or so) subbands if they get HF access bellow 30 MHz. That's
why I suggested them to not be allowed to do anyrthing but ALL digital HF
modes.

>
>
> 2) YT7MPB should send suggestions to the authorities in his own

```

Why? It seems to me that you Americans think you have some rights to force people worldwide to accept some standards you propose. I thought I could make some standards by myself and suggest to you this time to accept something.

One site I visited suggested that the soundcard approach pretty much
consumes all the system resources. In fact, the author said he went to a
real TNC since he really wanted to use the PC for something other than a
TNC.

Not that I am aware of, but there are a number of recent advances in PSK, for example PSK31 by Peter G3PLX and the fabulous MT63 by Pawel SP9VRC. This latter program is definitely not narrow - it occupies 1 kHz - but it is extremely sensitive and robust. It is a 64 tone MFSK technique operating at 10 baud for a throughput of 100 WPM.

Both PSK31 and MT63 have been realised on the Motorola DSP56002EVM development kit (commonly known as the EVM). Other software for the EVM includes Feld-Hell, MT-Hell and RTTY/AMTOR/PACTOR.

i have owned both the kamplus and the pk232 (you couldnt give me a
mfj)

the biggest difference ive noticed is:
the kam runs cool and is a nice small package AND i like the tuning
scope, the pk232 runs hot and is big and bulky. i like the trick
software that is available for the kam (pk-also for that matter)
the cool thing about gtor is, you can have a conversation with your
friends with kams with an almost certainty of privacy. it is faster
than pactor I. also, i have used kagold and patched hf cw contacts
over to 2 meter packet (and back!) by using the clipboard.... really
blew minds on the local packet net, to have them patched over to 40
meter cw....
just a thought......

The real question about this rig is can a ham hook up a computer and use the rig like it was a TNC. The answer to this question is unclear. It would certainly be a good rig (along with its mobile rig cousin) if the rig can both receive and transmit longer packets than it seems capable of in the ad. It's a nice toy, but a real built in TNC would be an even better idea.

I have a little yellow box that is driving me NUTS!!!!

It appears in the center of the screen and it looks like this:

```
|----------------------------------------|
|ZOOM .1 .2 .5 1 2 4 8 16 |
|----------------------------------------|
```

I don't know what makes it appear and can't figure out how to get
rid of it. I can often get rid of it "temporarily" by zooming in
or out several times or by re-writing the screen by hitting [HOME].

Can somebody tell me WHY it appears and HOW to get rid of it.

I also found flexnet to be somewhat cryptic. So when I got it up and running, I wrote an article that contains step by step directions on how to do it. You can obtain the article (in Microsoft Word format) at:

ftp://ftp.tapr.org/pub/wa0ptv

look for the file called "flexpac.doc"

I think you will find it relatively easy to follow.

Art,

Yep, you can hook it up to a PC and use it as a regular TNC.

5206. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <742nln$fko@news.Hawaii.Edu>
Source record: 21058
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and the contents of such a thread drift further and further away from being "on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman, KH6OO

5207. European APRS Frequency Proposal: 144.9125

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-02 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <yLK8BJA3gPZ2EweI@dowrmain.demon.co.uk>
Source record: 21059
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
European APRS Frequency Proposal

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

APRS (Automatic Position Reporting System [1]) is the fastest growing activity in packet radio today, and already has a very large following in the United States and Canada. The advent of affordable radios with built-in TNC and APRS support will undoubtedly fuel the fire.

APRS has the advantage that it only uses beacon-style unproto traffic. It does not require end-to-end connections, neither does it require the building of wide area networks -- network coordination is only needed with immediate neighbours a few miles away.

APRS also has the big advantage that only one channel is required for everyone, and indeed will only work properly if everyone is on the same frequency. The Americans have already recognized this, and recently went through the mammoth task of switching to 144.39 across the whole country.

Activity in Europe is very small by comparison, with only a handful of stations active at this time. We have a lot to learn from the experiences and mistakes of our North American friends, and the golden opportunity to "get it right first time".

We have to start somewhere. 144.39 is not appropriate for APRS in Europe, so for European APRS I propose instead the use of:

144.9125 MHz

This frequency is allocated to "ad-hoc" packet (no mailboxes) in the UK.

Comments please (from Europeans in particular).

73

>a sound card.

"More elegant" solution to what, exactly, and in what way? To a new Ham who discovers that he can get on the air for an outlay of three dollars or so (PTT interface) as opposed to spending 100 dollars or more to BUY a TNC which does not work any better and in some cases not as well, the FlexNet/Soundcard may appear to be a very elegant solution indeed. With the current scarcity of the chip used to homebrew BayComs as you did years ago, the soundcard drivers represent the best way currently available to achieve the same effect. (Heat up a soldering iron to get on the air for peanuts)

I used the souncard TNC for my first experiments with FlexNet, and it worked flawlessly. I later went on to use Tigertronics' BayPak modems much like your homebrew BayCom (but built with surface-mount components and a bit more resistant to RF-induced problems) and a DRSI card because I intended to run the FlexNet node option with multiple Radio ports. If I had no need for multiple Radio ports, there would have been no need for me to switch from the excellent DSP soundcard TNC driver written by Thomas Sailer, HB9JNX.

For more information on the FlexNet soundcard drivers and more, see Thomas' web site at:

http://www.ife.ee.ethz.ch/~sailer/pcf/pcfindex.html

>If I wanted to whine, I'd whine about the lack of interest in packet
>locally, but that is a dead end, too.

No need to whine about lack of interest in Packet. You or your local Ham Club can easily place the following items together in an envelope to be presented to interested new Hams in your area, and you will see a rapid

increase in interest in Packet there, along with a rapidly growing packet community:

1. A Floppy with FlexNet software and docs. (DOS/Win95 versions)
2. The three dollars worth of parts needed to build a serial-port PTT interface, along with the simple schematic for that circuit.
3. The Address/phone number of local Ham/Hams who are interested in helping new Hams get started in Packet.

Success or failure of any local Packet net is a matter of attitude, nothing more and nothing less. Those who choose to "sing the blues" and sit on their cans will have dead local packet nets and lots of discouraged Hams. Those who affect a positive attitude and actively pursue excellence will find it. FlexNet is the best way to achieve that excellence, and the soundcard driver is the best way to spread that positive attitude in your area very rapidly. It all boils down to you getting out of Amateur Radio exactly what you are willing to put into it.

>TNC.

I went through the above a week ago when I got hold of the flexnet files.
I read the english docs then copied one of the example batch files onto a
386
with a soundblaster card, put the required files where the batch file could
find
them and it worked. I used NPG as a terminal program (I'd never heard of
it
before I downloaded it) and it also worked without any problems.
The first test I did was C VK3BVP and I could hear my packets on the SB
speakers. So I plugged a lead from a 2mx rig into the SB line input socket
and it decoded packets off air without any problems. All seemed OK so I
made up a cable (PTT,TX,RX) ,plugged that in and my first con request was
answered. During tests the following couple of days I found that it would
work
OK with TXD <30ms and I could transfer files at a rate 20 - 30 bytes per
second faster with flexnets self adjusting parrams than with more standard
TNC\TNC settings. The next tests were to add another port using the KISS
driver back to another computer running BPQ\FBB\JNOS and FLEX didn't
miss a beat even when both ports were pushed. All tests were done on a
386 and it handled it without any problems at all. I'm still looking for
someone
within simplex range with 9600bd to see if I can get the 386 to run 9600
through the SB card (I doubt it), but it'll be fun trying.

As for starting a thread, if you are interested in running flex then why
not

join the flexnet mailing list.
Following is an extract from a message sent to me by the flexnet group after
I had requested the flexdigi files (sent to me with that message) from them.
now I'm looking forward to setting up flexdigi when I get off my current run
of shifts. I've been like a little kid on Christmas morning every day for
the last
couple of weeks :-) I exceeded my 120 meg per month download limit within 3
days of getting on the internet.

There is also a mailing list available where we place news about
our software and where you also can ask questions about FlexNet.

This genuine FlexNet mailing list is now available at QTH.NET !

QTH net has a few nice features, such as having [FlexNet] in
the subject field of each message, and the web-based subscription/
services they offer. Additionally they offer digests for the
mailing lists so you can also read about topics that were discussed
before you subscribed.

There are two ways to subscribe to the FlexNet list:

By E-Mail, you can send a message to

Majordomo@qth.net

with any title and the following as the message text:

subscribe flexnet [Your E-mail address here]

as in:

subscribe flexnet dl4vbp@qsl.net

The second method is to use QTH.NET's nice subscription/services
page at:

http://ns3.qth.net/

They have a great variety of Ham-related lists there, and the
webserver is the best way to look them over (just make sure that
your browser is capable of running Java scripts).

Sorry if my style offends anyone (LLL's excepted), but I've only been
on the internet for about 2 weeks and still have a bit (lot) to learn.

Bye, Shane VK3BVP.

Tom Sailor (who wrote the sm driver for Linux and PC/Flexnet) says
about a DX2-66 is needed, from memory. I use a K6-233 machine
under Linux and hardly notice that the soundmodem is running.

Unless I'm mistaken, Flexnet is for DOS so you can't do anything else
anyway?

(I'm not in Europe but) is APRS done on FM packet? Do most of your FM rigs
do odd frequencies like this one?

I have a Yaesu handheld which does 5kHz steps and a converted
ex-commercial rig which does 25kHz steps. All the FM parts of the bandplan
here in VK are in 25kHz steps. FM copes pretty well with being off frequency
but it's best not to design for it.

Yes, we do use FM, and we recently switched from 25 kHz to 12.5 kHz
channels in Europe.

Well, my handheld TH-75 can do 12.5 kHz steps as well as 5, 10,
and 25 kHz ones. My old FT-221 (analog display) has quasi continuous
coverage. The TR-9000 can at least do 1 kHz steps.
Newer rigs like the IC-275H have apparently only 5 kHz steps. Funny
enough ...

Just for comparison. I wonder why there is no handheld with 2.5 kHz
steps ... would be useful with all FM "channel separations".

This is hopefully a mistake regarding the frequency, otherwise they will
have a nightmare when flying over the southern parts of Sweden. We do
some heavy forwarding there over less populated area.....

I used the DOS FlexNet soundcard driver is an old microchannel 386-16 with no problem whatsoever. Excellent performance.

There are currently DOS and Win95 versions of PC-FlexNet. I believe there is a LINUX version currently in the works, but have heard that OS/2 will probably not be supported. I am not part of the FlexNet group, so it might be best to verify this info at their web site or on the official FlexNet support list.

My web page, listed below, has links to the relevant URL's. Just push the "FlexNet" button and go from there.

This is the "Radioless Ham Radio" deal the morons at TAPR have been pushing.
Personally, I think they are in cahoots with the commercial communications
outfits which stand to benefit when Hams lose spectrum.

Yes, I think the TAPR folks are worthless scum, not worthy of thier ham
tickets. (If they have any)

Little do you know Charles.

Why not actually listen to it before just passing judgment based on the title.

Don discusses how you create a network where the users
make up the network backbone. That is what Infrastructureless means.
He demonstrated the hardware and patch antennas they are using
in Chicago currently to implement some of this. A very good
technical talk focused on RF technology and design. All the overheads
are available for review when listening to the talk.

You should also listen to Tim's Sunday talk on the same subject.
How do we support millions and millions of high-speed users without
a backbone. This was his PhD dissertation at MIT. A very good
dissertation which is also on-line at http://www.tapr.org/ss
The potential of this approach in the commercial area could change
how wireless networking infrastructures are implemented. All from
the amateur radio community!!!

The keynote Saturday morning by Dale Hatfield, W0IFO, Chief of the FCC's
Office of Engineering and Technology was very significant. We were very
proud to have someone of Dale's stature attend the conference and
speak to the group. It shows the increased status of the conference
overall and I hope we can build upon this in the future.

This was one of the best DCC's we have had yet. You really should
think about coming Charles and learning about new things. Even an old
dog like you can pick up new tricks. At least get the proceedings
and read the papers. You might them interesting.

For those reading this, you can visit http://www.tapr.org/dcc
and listen to all the audio from the conference.

As usual Charles you want to point to just a few things TAPR does that
relate to the area you despise. TAPR is much more than just those projects
you harp on. Lucky for us, most everyone else realizes this.

Cheers - Greg Jones, WD5IVD

If all you are looking for is a demodulator as opposed to a modem,
the scanner MDT crowd has a couple of software modules with source
code.
I think it is called MDTW1234.exe . This uses a data-slicer of the FM
detector.
I dont think that the FECC works very well with this code.
A DSP implementation would be certainly better.

There is another module that uses the sound card.

Please search on the "geocities" web site for the software.

I wouldn't know about that... I run the DOS version of FlexNet so that I
can operate the Flexidigi module, which is not available for the Win95
version.

If you think FlexNet is complicated, try setting up old-style software such
as 'BPQ, *NOS, FPAC, NetRom, ect ect ect. You will discover that
comparatively, FlexNet IS "turnkey". - While being years ahead of the others
in it's general level of effectiveness and sophistication.

> It simply could not be that some folks actually
>do more than one thing at time with their computers and a CPU-hog

Not all jerks who try to run down packet are LandLine Lids of course - Just
80-90 percent of them.

Is there any particular reason you are sympathetic with the folks who are
well known for denigrating and undermining the efforts of Hams who are
interested in using Radio for digital communication?

My concern as to my "credibility rating" with any of the Ham-Radio bashing and Packet Radio bashing Lids can only be measured in sub-micro give-a-hoots.

>

Well, that puts you above the average "landLine Lid", which isn't saying much, but still does not justify your negativity and ignorant attitude. We have more than enough negative whiners in Ham Radio today. If you wish to be a positive, valuable part of the hobby, you'll need to come up with a new act.

>Same here,, very cryptic. Guess if I could speak german it might help.

Can you read English?
I got a couple of hundred K of English docs with my Flex software
(236864 bytes including a few bits from other sources) and I
subscribe to the FLEXNET mailing list.
Check out http://ns3.qth.net/
I found Flex very easy to get going. Though I didn't think I would have when
I first layed eyes on the docs, but after reading the english sections of
the docs and the dedicated English docs I found a very simple to
set up and run suite of programs for packet. There were only 4 parrams to
set with the set up I used. Years ago I used to have to send something like
40-50 parrams to a normal TNC running in CMD mode to get it to run just
the way I wanted it to (not keyboard to keyboard). That took weeks of fine
tuning to get just right (going for days on end without hearing another
packet station didn't help).
Have another look at those docs. And instead of looking at all the things it
can do, just look at the bits you want it to do.

Bye, Shane vk3bvp.

A widely held misconception. There have been some very good
multitasking programs (particularly DesqView) for MS-DOS systems.
Multitasking is NOT solely the domain of Windows.

True enough. I ran a DOS landline BBS system under DESQview for many years.
My experience is that it's not very good when dealing with lots of
TSRs and hardware drivers, like FlexNet is. Lots of QEMM exceptions
and so forth, especially with LAN drivers.

W0RLI packet BBS software runs under DesqView, and requires the use of G8BPQ node software, a TSR. I have not experimented with FlexNet under DesqView since I have seen no need to do so. Still, I wouldn't take any bets about it not working just on anyone's say-so. I'd have to check it out for myself.

Let's see... TAPR does 'other things" in addition to contributing to the destruction of the US packet network, so that makes it "OK", huh Greg?

Good to see you finally come out and own up to your "Radioless Ham Radio" activities. That took considerably more backbone than I would ever have expected to see from your direction. Either that, or you just made another of your "slips".

Kind of like the drunk driver who, after having killed an entire family in a wreck, claims he should not be censured because while he was at it, he never exceeded the speed limit.

Did I say FlexNet is complicated? I said it isn't exactly turnkey.
FlexNet is certainly pretty groovy, but it certainly isn't turnkey,
especially if you're trying to configure a Windows system to use it.
It really isn't directly relevant how it compares to other software
products used in packet radio, particularly when those other products
don't perform the same function.

> > It simply could not be that some folks actually
> >do more than one thing at time with their computers and a CPU-hog
> >program might be an issue.
>
> It's not an issue here. Older PC's are dirt cheap here in Texas.

This statement points several things out. First of all, you're happy
to dedicate a PC to run FlexNet, and, from above, you're running DOS
on this system. You're using FlexNet in a particular application

which makes several simplifying assumptions, which is a grand thing
to do, but then you launch off into flaming against people that
criticize the ease-of-configuration of FlexNet - even though you
admittedly aren't using FlexNet the same way.

Frankly, the "dirt cheap" argument for old PCs is rather unidimensional;
it doesn't take into account the physical space occupied by those
cheap old PCs, the power consumed by them (compare the power consumption
of a KPC-3 to an old 486 box), or the time spent tinkering with them.

The trigger for my posting was the ludicrous assertion that anyone
that criticizes FlexNet must be one of your evil LandLine Lids, when
it was obvious that you were overlooking some fairly valid reasons
anyone, even a packet enthusiast that shares many of your views, might
complain. That's an overly simplistic view of the world, and, what's
worse, given your inclination to politicize and posture, needlessly
inflammatory.

> >No, it couldn't be those things, they're

> Not all jerks who try to run down packet are LandLine Lids of course - Just
> 80-90 percent of them.

If you say so. Criticizing the ease of configuring FlexNet is not, to
a rational person, "running down packet". However, you don't seem
to handle disagreement well, instead choosing to engage in ad hom attacks,
specious arguments and several political techniques. Me, I get paid as
an engineer, and have little tolerance for these political devices.

> Is there any particular reason you are sympathetic with the folks who are
> well known for denigrating and undermining the efforts of Hams who are
> interested in using Radio for digital communication?

No, there's no reason I'm sympathetic with your LandLine Lids. To begin
with, LandLine Lids are primarily a creation of your imagination that you've
been actively promoting as a scapegoat for the ills of packet radio for
several years. I really can't be sympathetic with a figment of your
imagination, but even if I could, my observations about FlexNet are
nowhere near 'sympathy'.

In fact, Charles, I agree with several of your points regarding the erosion
of the packet network by non-radio networking. Attempts to make the
packet networks equivalent to the Internet are misguided and result in
a lot of poorly spent effort. The problem is that some folks are promoting
packet outside the core competencies, the things where amateur radio
adds value.

> >C'mon, you sound just like one of those loonies that attempts to
> >polarize folks on the code-requirement issue. Perhaps you've got a
> >good intention underneath all the blustering, but you've earned a

> >credibility value of zero through the incessant, gratuitous, flaming.
>
> My concern as to my "credibility rating" with any of the Ham-Radio bashing
> and Packet Radio bashing Lids can only be measured in sub-micro
> give-a-hoots.

Either you're trying to educate, or you're beating your chest in public.
Perhaps you wish to educate but can't help but beat your chest, but the
net result is the same. If all you want to do is rail against against
'The Establishment', you'll collect some followers and have a grand time,
but you'll add little value (other than entertainment) in the end.

> >Lest I earn a 'LandLine Lid' ad hom attack, note that I only operate

> have more than enough negative whiners in Ham Radio today. If you wish to be
> a positive, valuable part of the hobby, you'll need to come up with a new
> act.

Excuse me? I observe that configuring FlexNet is non-trivial to configure,
and now I am "negative" and "ignorant", a "negative whiner". Charles, OM,
you're so far off the mark you'd be booted out of most firing ranges. All
I've done is make an observation about a piece of software, and you've
gone off and painted me as "The Problem". Ludicrous.

I think Dana K6JQ hit it on the head in the other thread that is going.

"... you [Charles] don't seem
to handle disagreement well, instead choosing to engage in ad hoc attacks,
specious arguments and several political techniques."

Why is this ?

Instead of brining up totally irrelevant analogies on the topic, just
go to the web pages and actually listen to the talks.
The audio is all on the web page in question: http://www.tapr.org/dcc
Go read Tim's paper ftp://ftp.tapr.org/tapr/ss/MIT-LCS-TR-670.pdf

Learn from this information.

At your current rate you just continue to prove to people that you
have nothing better to do then attempt to tear down others that
are actually trying to do have fun in the hobby and learn stuff.

This is just turning into another Charles ramble on topics you
don't understand and will not take the time to actually
research.

I'm sorry but I don't like the idea of paying $349.95 for the KAM and later find out
that its no good, unless I pay an extra $69.95 for software (a total of $419.90 !).
Specially when considering an MFJ-1278B is only 299.95.
But I do agree that the KAM gets better with the appropriate software.

>> Will freeze on occasion and needs a cold-boot to start again (seems like a

That's strange. I've had those with both the KPC-9612 and the KAM Plus on two different locations/computers/users. However, it's not a big problem.

FlexNet Info for US Hams
by Charles Brabham N5PVL

FlexNet

FlexNet is an amateur packet radio networking system, just like NetRom, ROSE, TexNet, FPAC, ect.. The following statement, quoted from the FlexNet WWW home page, best describes the essential difference between FlexNet and the other amateur packet radio networking packages...

" It's like re-inventing the wheel, and getting it right this time. "

This is a bold statement for FlexNet's authors to make, but it is also quite true. FlexNet is a completely new approach to packet networking, and its special features directly address many of the problems that have frustrated packet operators as well as networkers in the US for a long time.

Adaptive TNC Parameters

Perfectly set TNC parameters are essentially a compromise, which the operator hopes will be appropriate more often than not. Many hams try to stick with the default values as much as they can, and others experiment endlessly.
The fact remains though, that TNC parameter settings which are set for crowded or poor conditions will be grossly inefficient when the link is clear and open, and TNC settings for good conditions will completely tie things up when link quality goes down. So, even when everything is set "right", it's really only right a small part of the time.

Unfortunately, not every ham agrees as to what settings are "right", for obvious reasons. Even worse, not all TNCs are set up "right" in the first place. Many are downright wrong!

The static TNC parameter settings we have become accustomed to in the US have led to compromised, needlessly poor performance within our networks, along with a lot of confusion and controversy... It's been a complicated mess.

FlexNet handles this problem through the use of adaptive, dynamic TNC parameter settings. What this means is that the FlexNet software itself determines how the TNC's parameters should be set, constantly adapting them to changing band conditions, levels of congestion, and timing factors for each individual connection. The operator has to set the TXDELAY parameter to suit his equipment, but FlexNet then handles FRACK, PACLEN, MAXFRAME,

RESPTIME, PPERSIST, and so on.

This feature eliminates many arguments and greatly simplifies the setup of FlexNet packet radio stations, but it's main value lies in the drastically increased efficiency it offers over static link parameter settings found in TNC firmware and in the old-style networking packages currently used in the US.

When the link conditions deteriorate, FlexNet backs off on the link parameters enough to avoid excessive resends and retries. - When conditions improve, FlexNet "opens up like a hose", utilizing much more agressive parameter settings than a sensible set of static TNC parameters could ever utilize. The result is better throughput of data under all conditions.

This system has a lot to offer. In places where FlexNet has become established, throughput and channel capacity have risen dramatically. Everything simply works better, and faster, even if you are still using the same old radios and TNC's. This is because FlexNet squeezes every last bit of use it can out of the radio link, responding and adjusting itself to ever changing conditions and loads and intelligently managing it's traffic with other stations.

Hidden Transmitter Syndrome

HTS is a major problem in the US packet network. Various fixes have been tried, but even the best (digital repeaters) are limited by the timing characteristics of the SLOWEST radio on the channel. The result is serious problems with collisions and unnecessary retries which get rapidly worse under poor or crowded conditions.

FlexNet nodes handle this problem with a polling system that makes all stations connected to the node, be they weak or strong, wait their turn and only transmit to the node when they are polled. This DAMA access system is optional, and requires that users utilize DAMA capable drivers for their term programs, (Like FlexNet, for example) in order to enjoy its benefit. With its use, there is still some danger of collisions during the initial connection to the node, but little or none thereafter, no matter how many stations are connected and whether they can hear each other or not. FlexNet as a driver operates as a DAMA "slave".. FlexNet as a node can be a DAMA "Slave" or "master", with the option being set up on a port-by-port basis, as needed.

Routing

Of the various routing systems commonly used by hams in the US, the totally static system used by Amateur TCP/IP is the least sophisticated, and the most advanced is the automatic routing system built into NetRom/TheNet/BPQ. Even this system suffers from "static parameter syndrome" though, providing limited (set) responses to infrequent updates which vary wildly in "quality",
depending on which neighbors the network info comes from, and propagation

conditions.
NetRom nodes in my area, for example, regularly show other NetRoms from over 500 miles away on their NODES lists.. You can't connect to those nodes, of course, but they still get listed because their ID's were "heard" during the course of intermittent peaks in propagation on 2 meters.

FlexNet handles this problem by regularly polling other nodes and routes within the (FlexNet) network, providing each node with a real-time, dynamic picture of which routes are currently fastest to any given destination within the network. As conditions of propagation or utilization change on any given
link, so does its routing status. Connects through a dozen or more nodes are regularly and reliably done on the existing European FlexNetwork, due to the advanced routing, and the full-duplex node-node links they use there.

FlexNet actually uses several routing systems, which are utilized in turn to resolve routing. For a better description, see the "Official FlexNet Introduction" written by DK7WJ and N2IRZ, which describes the routing hierarchy in detail. It is available at the URL below.

Reality Check

Above I have lightly covered what I understand to be the major features of FlexNet, with emphasis on common problems in the US packet net which FlexNet directly addresses.

Still, there are many considerations besides "features", when evaluating potential software for packet networking. Here's a few short statements which should clear up many questions.

Though development of FlexNet continues, the software is much more reliable and stable than usual for such software. It's not bug-prone. I've been running it several months now, and still haven't managed to "crash" it.

The PC version of FlexNet can be inexpensively set up, using:

TNC2 (clone) <-- Requires use of "6-pack" EPROM image, allowing up to eight TNC's on one Com port. No KISS driver available.

Tigertronics BayPak modems (1.2 or 9.6 kb) <-- US distributors for BayCom. These modems are inexpensive and reliable.

Soundblaster ;-- 1.2 or 9.6 kb, but requires LOTS of CPU, memory, ect.
Uses a Com port for PTT, ect.
A good cheap way to experiment, or to get a packet station started on a budget.

And many others too numerous to list here, including high speed stuff, ethernet drivers, IP, ect.

If you're only running a few ports and have plenty of RAM and CPU, you can shoe-horn PC FlexNet and a BBS or Cluster into the same machine. Faster computers with more RAM will handle more, of course.

The Win95 version of PC-FlexNet allows use of Win95 applications (such as Netscape, ect) and Win95 tcpip server software with Amateur TCP/IP or AX25. This is something else which should have been done long ago, and is just as revolutionary as FlexNet's adaptive parameter settings, in it's own way.

Where/How to get FlexNet

If you want to use FlexNet for a personal station, to run the Win95 version, or to use FlexNet as a driver for a BBS or Cluster, just download the latest files from the FlexNet web site. Those files will do everything except operate FlexNet as a node.

The authors of FlexNet wish to be the sole distributors of the node option, and require those who are interested in operating a FlexNet node to register with them by way of an E-mail request. Also, the latest version of PC/FlexNet to have the node option is v 3.3e (DOS) . The later versions do not as of this writing have node support.
Once you have made your E-mail request, the optional node software program is returned to you via E-mail as a message attachment. The drivers and application software is freely distributed at the web site, as are the docs.

It's all free.

(Ahem!) The authors state that though they do not want FlexNet freely distributed to just anybody, registered SYSOPs are quite free to pass a few copies to their friends. (Local Node-Ops, I would presume.)

Good luck!

From: Walter Dunckel <wdunckel@best.com>
Message-ID: <3667FA45.AF13450F@best.com>
Source record: 21155

HELP!
I was hoping someone might be able to answer a question of mine. I am not yet an authorized user of WinAprs (though the check is in the mail).

I can't seem to feed local data to the internet thru the tcp telnet port. I
have checked the feed local data box under tpc setup and I get data in the oposite direction. Is this a function of not being authorized?

I thought the only functions unavailable were saving the setup and routing messages FROM the internet TO the TNC (Fcc laws etc.). Am I missing something?

I have tried using different telnet ports and cant seem to feed any of them.

Thanks for any help you can give me,

Walter

Gosh. THe box is the result of the mouse clicking the Right button I
believe. When I see this, I usually find something sitting on the
mouse buttons. THe idea is, that you can click on this yellow box with
your mouse, so you dont have to use the keyboard.

I know - its something that seems not to want to go away.
I have had problems too, with the mouse comming unplugged when just
after it h ad "click" its button and brought this up.

From APRS MOUSE.TXT file

MOUSE.txt 7.9 MOUSE SUPPORT

MICE IN APRS:

With the mouse you may move the cursor and use the left button to HOOK
any station on the screen. When hooked, most of the information about
the station is displayed on the bottom line. The right button marks a
location and brings up a ZOOM menu. HOOK one of the ZOOM factors with
the RIGHT button and the map will zoom. Hook the upper left cursor
POSITION display, and the P-LIST will be displayed. On the P/L-lists,

use the LEFT button to hook a keyboard menu and display all data at
the
bottom of the screen. Or use the RIGHT button to ZOOM to that
station
on the map.

I have seen APRS in use live during a charity walk - stations at each end of the walk reported positions live, and other APRS stations popped up at various times.

I do have a problem with that freq tho - as quoted by another person - if you are going to dedicate an APRS freq, then it will tie up a radio on one frequency, logically this will be an old radio - aprs doesnt transmit much so it will be perfectly possible to still use 2m whilst an aprs station is running - old radios will tend to offer 5kHz at best. <shrugs>

We do need a frerquency tho - Ive always thought that a spot frequency on 4m would be the most useful, and generate activity on that band too.

Hi Jack,
Have you read the documentation at all? It's pretty good.
There are several APRS elmers in your area, they are:

John Langtry - ve3nec@peel.com
Mike Walker VA3MW Mississauga - mwalker@interlog.com
Steve DuBois VA3HOI Port Sydeney steved@vianet.on.ca
And
Dave VE3FGK Toronto ve3fgk@projectx.com

Also, go to Bob Bruninga's web site:
http://web.usna.navy.mil/%7ebruninga/aprs.html

Usually hitting the spacebar or the escape key will do it for you.
It's a been awhile since I ran the program (I know, shame on me!) so I can't
be more specific at this time.

73,
Tom

you can be sure that original Soundblaster will cause less problems or
difficulties than "compatible" ones, even though there might be a few
doing fine. So you want to look for a SB 16 / 32 (AWE) / 64. At least
these contain the AD chipset.

What Soundcard were you using in that 386? I've tried a 386/33 with both a SoundBlaster Pro, a SoundBlaster 16 and a Breve (?) SoundCard in Windows Sound System mode, and it either locks the computer solid, or I just get a high-pitched whining noise from the outputs.

Regards. Paul.

I usually set my KAM's cwtone to be 1000 Hz. This way, my actual
RF channel frequency is 1 KHz above my indicated frequency on
my radio's display. It is easy to see exactly where I am transmitting.

A lot of DOS packet software was written with DV in mind.
I used to run FBB,BPQ (tsr), two copies (versions) of JNOS
and usually had XTREEGOLD running as well with DV and QEMM. With
room for extra stuff that I ran from time to time.
I now run FBB,BPQ and one copy of JNOS under windows and that's
about it. Everything on the Windows computer is bigger and or faster
than on the DOS computer, but I can't run as much or as fast as I did with
DV.
Under DOS, everything would run for weeks without any problems. Only being
rebooted when I changed something in a config that needed a reboot.
Under windows I get at least one major crash per day. The system is that
overloaded that I get overruns on all ports and underruns on the internal
TNC's.
I went from a typical retry rate of 1% under DOS to around 20% under
windows.
20% is still low compared to some of the BPQ nodes I've logged onto that run
under windows.
I have to seriously look at spending some hours some time in the next few
days
either reloading windows and FBB and hoping things improve or going back
to DOS where everything ran like a charm at lightening speed on a slower
computer with less memory and smaller hard drives.

Anyway you can get a secondhand computer with sound card for less than the
cost
of a new TNC and your good computer is left free for more important things
like
playing games.

Power consumption can be a factor. I get some funning looks when my wife
walks in
and sees me sitting here with 3 computers and umteen radios running. And I
keep a low profile when the electricity bill turns up.

It's a sound blaster sound blaster. There is no reference to a model number
in the manual. I think that when it was made there was only one to choose
from.
I've had it for a long time. It's pre windows 95 by a long time. External
volume
control and AGC on the inputs. Very easy to set up though, just adjust the
pot
for deviation and the input looks after itself. Better than stuffing around
with
software level controls like on the newer cards and it doesn't need drivers
to
set itself up. It didn't work at 9600bd though.
I also tried a PnP card that I had never been able to get working before. It
came
with a second hand computer that I'm now using as a BBS. I tracked down DOS
drivers for it and it also worked. Seems to work at 9600.
Also tried flex on this computer (233MMX on board sound card) and that also
worked

once I'd loaded the dos drivers for it. I had to stuff around for an hour or so. The people
that wrote windows and invented PnP should all be lined up against a wall and shot.
Another local got his working also. He is now looking for a terminal program that will run
without HI mem on a 286, but I think he is pushing it a bit far.

Found it to be a bit slow with DV. Flex and the sound blaster modem seemed OK, but the
terminal program was a bit slow updating the screen.

Bye from Shane vk3bvp.

Any idea why they didn't choose the 144.800 freq for Euro APRS? I may
be completely missing something in the bandplan, but this looked
pretty close to the US freq and might allow sharing of duplexer
designs, etc without additional hassle...

The initial proposal is flawed :(The Data Comms Committee have plans for 144.9125. I have suggested that we use 144.800 as its designation is data/emergency priority and of course APRS will be extensively used by Raynet etc.

If you regularly use APRS in the UK can you drop me a message as I'm trying to keep a database for co-ordination. If you're feeling helpful I'll put you on my webpage as an Elmer for your area.

YOu only need transmitters for the band or bands you want to transmitt on and recievers for the bands you want to receive. You don't need seperate complete units.
You will need ssb or cw to work most of the birds. For the low ones which at this time is all but Oscar 10 , most can be worked with 100 watts or less into crossed dipoles.
It never hurts to have a small beam that can track them and less power.
You usually transmitt up on lsb and listen on usb.
There will be about 10 KHz of shift as the signal starts out high, then is on, then is lower in frequency as the bird passes over. You do not need a seperat unit, but it is helpful to have a seperate receiver from the transmitter so that you can hear yourself comming back so you will know where to listen for your replies. Also quiet often , you normally adjust your transmitter on the 2 meter uplink birds so you do not move the receiver. Hard to do with just a transceiver. YOu can use a receiver converter going into a lowband rig if you want to.

Should not matter since FM synthesis or Wavetable only refers to MIDI
playback -- not digital sampling.

TCP isn't a link layer. It is transport layer. Link layer needs physical
media control, TCP doesn't provide that. The retransmission timers
in TCP aren't suited to link level ARQ.

But what happens if the ACK is corrupted? Then the sending station
will keep on retrying.

>Now normally the links are reliable, but the case of a bad link showing up

UDP has no acks and no retries. If the data is missed, it just falls on the floor.
TCP's retransmission timers will back off, but they won't quit. Neither of these
does what you want.

What you need is a DAMA link layer that *polls* each station for its data.
The slave stations never transmit unless polled. That gives the master
total control of the channel.

Thanks for the reply.

To make things a little clearer, I will not use the term "link."

I have a network which will interconnect sites via radio and internet.
These sites provide data every minute. If they are late, too bad, they
get dropped for that cycle.

What I would like to do is use TCP as it is a reliable transport. But
this is a problem because it wouldn't be economical to kill the
virtual circuit every 50 seconds if they time out. I guess I'm answering
my own question, in that the UDP protocol seems more appropriate,
but that I will have to add-in the reliable part.

Yep. Set your application up to poll for data from the slaves. Use
UDP as the transport. Poll a slave until you get a response, or
until timeout, whichever occurs first.

Hello all..

I'm trying to connect my PK-88 to my IC-32AT (Icom 2m/440 HT). I don't have the pin configurations for the 32AT, so I've been shooting in the dark. I've gotten it to receive and key the transmitter, but not to transmit any audio... Anyone have this information handy? If so, I'd appreciate a response...

Thanks and 73...
Rick N4VZT

Source record: 20996

Actually it's a "store" of data. That is, one node will connect to another node, and they will exchange data. A third node may then connect to one of the original two. These two nodes then share data. The node not connected to this third node, will get the data from the second.

Thus a string of sites will get their data from their nearest neighbor. Each site shares it's table of connected nodes with it's RTT (Round-Trip-Time) entries. The first node may find that it is closer (plus or minus a factor) and negotiate a new position in the node list.

The data is mostly bearing and range type of data, and it isn't important that dropouts exist, but errors are detected/ corrected.

It's not really conducive to polling, as there is no master.

Rick'
The PK-88 manual has a wiring diagram for "all ICOM hand-held radios" - as
follows:
for the large plug (receive) green=tip
brown=sleeve
for the smaller plug (xmit) red=tip with a 22k resistor in series
white=tip with a 1uf cap in
series
shield=sleeve

Just in case you don't have the original cable for proper color codes -
here is the color to pin id :
pin 1=brown ground
pin2=white mic audio
pin3=red ptt
pin7=black squelch input (optional)
pin8=green rec audio
pins 4-5-6 no connection

Hope this helps

It is possible to reset the MFJ-1278 to a different CW frequency than the factory pre-set choice. There is a bulletin from MFJ that MFJ tech support will send you on how to do it, if you ask for it. I don't have the letter they sent me here at this location, but I got such cooperation from them when I asked. Memory says that you have to have a frequency counter to do the job, but. so said, it can be done.

5287. TCP Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-06 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <HOxa2.350$gf.361585@news.goodnet.com>
Source record: 21183

I have a system I'm working on, that has a one minute cycle time. The data
is
displayed from many remote sites. Since the links may have noise, or other
random problems, I want to use TCP as the link layer, as it is a reliable
protocol, and errors will result in a retry.

Let's say it takes 10 seconds to process the data, so we have 50 seconds to
retry.

What happens past 50 seconds? If the data is still corrupted, and the
processing cycle is near the end, I don't need the data anymore. I'd like
to
just ACK it anyway and drop it.

Now normally the links are reliable, but the case of a bad link showing up
has to be considered.

Am I correct in assuming that UDP must be used in this type of application?
Or, is there a standard way of using TCP and just ACKing after a time-out?

>Richard G4BBH

The hot deal these days for the TNC2 is to get an old PC for the node site, and run PC-FlexNet with the "6-pack" EPROM in the TNC. Depending upon what speeds you are running, you can stack up to six TNC2's on one Com port with 6-pack.

FlexNet offers adaptive TNC parameters, multiple routing systems, optional DAMA access to eliminate HTS, and transparency. Whatever goes into a FlexNet net (IP, ROSE, NetRom) is what comes out the "other end" as well.
The addition of a PC to the node site may be a hassle, but by doing so, you can be running modern software, much more capable than what you are accustomed to using now. A bonus is that PC-FlexNet is also much easier to set up and maintain than old-style networking packages such as NetRom, ROSE, TexNet, BPQ, FPAC, *NOS, ect. It is also particularly stable and bug-free compared to other networking packages. My copy of PC-FlexNet has been doing Packet BBS duty for over six months now. It has never crashed or hung up. It will run off of a floppy, if needed.

For more info on FlexNet, see my web page listed below. Just press the "FlexNet" button and go from there. Good luck!

I would have thought that a first step is to get packet users to change their TNC BTEXT so it sends their location in APRS format. (Which is now common practice in this area.) Once that happens, then they can run APRS software on the "normal" packet channels in receive-only mode and see the various stations appearing on their maps as their beacons are heard. That might or might not arouse enough interest for people to move to a dedicated channel.

That is happening in a lot of places, but it is time that a dedicated freq was found. There is a lot more to APRS than icons on a map and these operations should not take place on BBS access freqs. It's quite frustrating just seeing icons on maps and not being able to use all the other aspects of this superb software.

My QTH is in Suffolk and I can regularly hear Northampton, Kings Lynn, Croydon, so if you're in one of those areas or in between, and even up to Lincoln, spark up APRS on 144.800 and see if you can get a response from me. This really is the way ahead and beats reading the same old abusive bulletins every day.

For UK maps have a look at my web page, DOS maps should be available by the end of December

5299. Pk-Term '99 Preview 1.2 on the web for download

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-07 00:00:00 UTC
From: hamradio00@aol.com
Message-ID: <19981207130943.01088.00001566@ng-fi1.aol.com>
Source record: 21002

The new 32 bit Windows program for AEA/Timewave TNC's is now available in Preview form on the web.

Pk-Term '99 is a full feature Windows 95, Windows 98 and Windows NT Host mode interface for all AEA/Timewave TNC's. The program can be downloaded from the web at http://www.cssincorp.com/pkterm.

A suggested retail price of $69.95 will be offered to the amateur radio community for PkTerm 99. Purchase can be made through Timewave. The program also offers a demo mode which, while limited in functionality, will be free. Demo mode for packet only will allow single port, multi stream packet operation for the Timewave TNC line. Purchase of the full featured version will include a free upgrade to all updates up to version 2.0; hence users need not have to worry about upgrade costs and fixes with a version 1.x product.

PkTerm ®99 for Windows 95, Windows 98 and Windows NT host mode terminal program for the Timewave® TNC®s takes advantage of the true multitasking capabilities of Windows 95, Windows 98 and Windows NT and uses standard Windows commands for ease of use. From CW to HF packet, from single (PK-232)- to dual-port (PK-900/DSP-2232) TNCs, it's now more fun to use the digital modes of amateur radio. Capabilities include:

SIAM Mode
Multi-stream, multi-port support
Stream selection with a click of the mouse
Text and binary file transfers
User defined colors and fonts for received, transmitted and command text
Separate window for non-packet HF modes, from CW through NavTex
Multiple monitor windows (including network traffic window)
File level compatibility with the Microsoft Office suite of products
Mini logging program using Microsoft Access database compatibility
Support for CDROM based Callbooks (Sams, QRZ, Buckmaster, Flying Horse)
Works with all AEA/Timewave TNC®s that support Host Mode

Is that so? What then, would you care to suggest? Some of the old
static-parameter stuff?

For info on FlexNet, see my web page at the URL below, push the "FlexNet"
button and go from there. No need to stay mired in the past, OM. No need at
all.

5304. 9600 Modem Audio Drive

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-07 00:00:00 UTC
From: James Jefferson <jjeffers@deskmedia.com>
Message-ID: <366C6DCF.6D63@deskmedia.com>
Source record: 21007

Hello everyone,

As building my digital repeater is comming to a close (read: it is time to do the final tuneup) I need advice on how to boost the audio drive on the TAPR 9600 modem board. I'm feeding a Motorola Mitrek per Bdale Garbee's recomendations. With the 2.75V peak-to-peak that the modem puts out it generates about 2.25KHz of deviation. Can I configure one of the internal op-amps for a higher gain without too much distortion? If not can anyone make any recomendations on an external op-amp? Any suggestions?

Thanks in advance,

-James Jefferson KB0THN

No problem with using a computer for those that have them along with
the room. At the moment the compactness of the TNC serves well inthe
gravy train node site and the crowded shack for thr PVL node(KS). To
answer the original question X1Jr4 is the latest I know of. Well I went
to http://www.cam.org/~burt/neda/NEDA.html and saw nothing newer...

On Sun, 06 Dec 1998 22:47:44 GMT, ke4zv@bellsouth.net (Gary Coffman) wrote:

: Yep. Set your application up to poll for data from the slaves. Use
: UDP as the transport. Poll a slave until you get a response, or
: until timeout, whichever occurs first.

With one master and n slaves along different and varying RF paths that have to be polled every T seconds, this algorithm can be improved a bit.

In the original algorithm, one bad link is polled T/n seconds before going to the next and in a normal case there will be some unused time at the end of T. With constantly varying propagation (e.g. slip rings or radio propagation on HF or non-line of sight VHF/UHF) the propagation may be bad to slave A and lot effort is concentrated on polling it, while the path to slave B might still be good. When the propagation to slave A has improved and a response is finally obtained, it is time to concentrate on slave B, but the propagation to it may now have deteriorated.

However, by first polling through the whole slave list without attempting any retransmissions of corrupted or missing responses, will quickly get all (at that time) "easy" slaves and more time (more than T/n seconds) can be spent on the more problematic slaves. When going rapidly through the unread slave list, there are better chances of hit a good propagation to some slave, if the typical propagation variation speed is in the order of T seconds. If the propagation (or interface) variation rate is much shorter, then it makes sense to constantly poll a single station.

In a typical situation, most stations would be received in a single poll, some may require two polls and maybe one would be the hard case, but fortunately, you may still have T/2 or T/3 seconds left to poll this single slave until the total period T expires.

ROTFL... <thud> ROTFL...

You sure got me there Chuckles... I guess if I were inclined to think
that "stupid" was even close, I might be mildly concerned... Considering
who you seem to be, being called stupid by you appears to put me in fairly
decent company... <grin> Maybe you'd like to try insulting my mother,
or my fiancee now?

IOW, BZZZZZZZZZZ... Wrong answer Slappy... Try again...

: Get a Ham ticket, then come back and pretend you know something.

Ouch... That stings...

Why would I want to do that Charley... You've got the ticket, and
you're doing a FINE job of pretending you know something... You
RULE big guy... I'd hate to erode your little ego empire...

Anyone ever tell you it might be time to "shut yer big pointless yap"?

You (and others like you) are precisely the reason I've avoided getting
an amateur license, Chuck-o... I always have better things to do than
argue nonsense at knuckleheads... (and from what I've read of everything
you've posted, you don't really seem to make much of a contribution here,
short of comic relief... It'd be easy enough to write a simple AI to
do what you do...)

Sooooo Chuckles...

Shuffle on home now... No more time to play... <swat> <swat>

If you have ever wondered about the correlation of possesion of an Amateur Radio License and relevance, monitor 14.3 mHz, USB. Like any other group of individuals, many hams are interesting, informative, and intelligent. Then, there are the others......

btw, I do possess a valid license, so I guess I can pontificate to my heart's desire on this ng.

Bzzzzzzz... Wrong answer, Chuck-o...

As seems to always be the case where you are involved, Chuck,
you are misinformed... I am not trolling... If I were trolling,
I would be attempting to disrupt the entire newsgroup by making
some inflammatory statement that is likely to draw fire from
a large group of people... Telling you that you are a knucklehead
is *NOT* inflammatory, nor is it likely to directly draw criticism
from the members of this group... It is becoming rapidly apparent
to me that you are, in fact, a knucklehead... incapable of applying
even basic comprehension skills... NOTE: Im not stating that you don't
have 'em, you just don't seem willing/able to trot 'em out for day
to day use... I won't bother commenting on your inability to construct
a logical argument, or firmly anchor *ANY* argument in reality...

Im here Chuck... Im here to stay... Im here to participate...
I don't have an "amateur license", and Im not a gettin' one chief...
If I *DO* get a license, I'll only do so so that I may earn a place on
your "Landline Lid" list...

Best Regards!

I just have one simple question I would like to ask all you people who have somehow made it a part-time job to flame everyone else about how worthy they are to be in a newsgroup:

Did the original sender of this subject ever get an answer to their question?

I love amateur radio, ladies and gentlemen, but you are making it very difficult to convince other people about how good our hobby is. We are NOT a private organization, nor should be restrict anyone who has a valid question relating to the hobby EVER not be answered with dignity and respect.

Don't make all this personal! You don't know each other; you've never met before face-to-face, and if you don't like something that was said; take it outside the newsgroup or filter them out. Life is too good to be spending time hating each other.

Steve Sampson wrote in message ...
>Bark, Bark, Bark!
>
>You sent this message a year ago. Don't you have any new material?

Yes, but since what I wrote a year ago needed only minor editing to be brought up to date, I saw no need to "re-invent the wheel". Although the same old loudmouths are here as usual, the much larger group which makes up the rest of the population here is in flux, with folks coming and going all the time.

If, for some reason, I feel that the information in that message needs to be shared again at some time in the future, I'll probably go right ahead and do so. You'll probably go back and cut 'n paste your same old tired omplaints. - So what's new?

Anything new in your area, Steve?

Have the Hams in your area started to modernize yet, and put up a few FlexNet digis? There's really no excuse for using old-style static-parameter stuff if you really want to see your local network perform better. DAMA access allows everybody, even those guys with HT's to efficiently utilize packet. As for routing, FlexNet uses the link to the destination which is *currently* the fastest, not one which is manually entered into static routing parameters by a SYSOP. I think that if you read the Intros and think it over, you'll be wondering why you've been wasting your time running nostalgia software and putting up with lousy performance when you don't have to.

Yes, they did! Very early on, I answered the question and was soon after attacked by users of some of the old-style systems which are not capable in this regard. Then their non-ham buddies "joined in".

At the URL listed in my signature, press the "FlexNet" button, then read the article "Packet Radio with a SoundCard". This is the info I offered. It costs three bucks or so to set up. You will notice that the article makes special mention of how to use the same software and Soundcard to monitor packet at no cost whatsoever. (The parts are needed for a PTT interface, not needed for SWL)

John, I don't think you'll find too many other people like the Rev. Babbling Charlie, preacher of the gospel of the non-existant global packet network.

Charlie's been pretty bitter since he lost his job as a BBS SYSOP....

He probably holds the world's record for being the most obnoxious asshole to ever have a ham license. His TNC goes at the amazing speed of 1200 baud, but his brain is still stuck at 110....

Nobody left for him to preach to on packet, so now he's an internet preacher, stuck in the basement behind his keyboard using TCP/IP to preach the evils of TCP/IP. Whatta guy.....

Hi all,

After a confirmatory chat with the DCC I can confirm that 144.800 is now cleared for use as an APRS freq. If you intend to use APRS at all can you try and keep it on this freq as it's the only way that a national network can be built.

I urge you all to put your BBS and email address in your status text so that you are contactable by both means. This has worked for me already as I have been contacted by Raynet.

If you have not already heard there is an excellent APRS Special Interest Group run by tapr.org Joining this mailing list will enable you to get the very latest information and developments with APRS. To subscribe send an email to listserv@tapr.org with the words subscribe aprssig in the body. Alternatively , surf to the bottom of:

http://www.tapr.org/tapr/html/sigs.html

and do it there.

Hope to hear you all soon, happy tracking....

: disrupt this newsgroup, and will report the persistent ones to their ISP's.

1) As has pointed out to you several times, Charles, possession of a
ham ticket isn't a prereq for participation in this newsgroup.
Sorry. You are riding on Usenet friend. As long as you use
MY machines to move *YOUR* news, I'll participate in ANY
group I darn well please. If you'd like to argue this point,
go find yourself a rolling doughnut... (NOTE: If you have a
copy of the charter that established this newsgroup, and you
can show me a passage that indicates that an amateur radio
license is required to participate, I'll gladly "buzz off"...)
I find your opinion regarding this subject to be VERY offensive
both professionally and personally, and Im going to air
my opinion regarding this. As much as you may dislike this,
Charles, I have as much right as *YOU* do to air it. (again,
unless the charter specifically states that I MUST have a
valid amateur license to post here)

2) Don't threaten people. It's bad form. If you want a point of
contact to make a complaint regarding ANY of my posts, Charles,
email me... I'll gladly provide the name, telephone number,
and email address... I would heartily, and as professionally
as possible, recommend that you have a valid complaint before
doing so. No one likes their time wasted. I suffer wasted
time and fools less gladly than most. As it stands now, you
don't have a valid complaint (against me, at any rate). I've
done nothing but stand my ground regarding your mythical
requirements for participation in this newsgroup (and defend
myself against your persistent and borderline libelous
personal attacks).

3) If you don't want to hear from me. Kindly learn to make proper use
of your kill-file...

: So far I have been annoyed by trolls, spammers, ect, but have never hated
: one. They are sick, sad folks, for sure.

Oh... wait... Sorry Charles... I've neither "trolled" nor "spammed", so
please, accept my sincere apology. I think you must not have been

talking about me. BTW, anyone that disagrees with Charles Brobham isn't classified as a "troll" or "spammer"... Argument is encouraged Charles... People that try to suppress argument, or disagreement with their *OPINIONS* are known as "closed minded", or at worst "kook"... Kindly look up the terms "spam" and "troll", Charles, you continue to misuse them, and I find it personally quite annoying... (I guess I could be classified as an "etc"... Does "etc" mean "people that disagree with me"?)

That being said... Is anyone here working on ad-hoc routing algorithms? Im currently singing up a design for a MDR spread spectrum RF modem (currently point to point only), but one of my colleagues is looking hard at optimizing routing in an ad-hoc mobile network environment, and Im wondering how much "pollen" there is in the amateur community at this point... (I mention the modem design, because it's unrelated to my "paid" work, and will probably be released into the public domain when completed, and Im a bit interested in the "interest level"...)

Best Regards,

-jw

Tim Shepard, KD1KY did his PhD dissertation on an infrastructureless network architecture; it might have some relevance to your ad hoc mobile environment question. He gave a presentation on it at the 1998 ARRL/TAPR Digital Communications Conference in Chicago, and the dissertation and his presentation materials are available at the TAPR web site (www.tapr.org, though I don't know the exact URL).

If packet radio needs legislative protection to exist, (can you imagine
going to congress with such a request) it probably doesn't deserve to
survive.

I didn't see this message a year ago.

I think you head the nail on the head, Charles. I've seen all
the arguing on here for several months. I don't wish to get
invloved in the arguing which usually results in name calling.

I agree with everything you said. I admit guilt in using the
Internet Gateways; but I don't argue that it is cheating. It is
cheating! No question.

I've been using packet for about 3 years now. At first, I tried
send messages using the "all radio" packet system. It regularly
took about a week to get a message from Phoenix to San Diego,
a distance of 400 miles. So, I turned to using Gateways.

It's too bad that we can't get a little more efficient!!! The other
thing that "bugs" me is zillions of useless messages going through
the Packet Forwarding System. I don't want to read about a radio
for sale in South Africa. I don't even want it to show up on the
BBS is Phoenix.

Perhaps if the sysops would cut out sending those useless bulletins,
they could concentrate on providing "efficient" handling of messages.

That's all. You probably won't hear from me again. I hope I
didn't start any more trouble here.

Nope. KPC-3 and KPC-9612 all the way, using the Netrom clone
software from Kantronics. It's fine for 1.2 kbps and 9.6 kbps.
Mostly keyboard chat. The BBS freq is too busy forwarding to get
in to use it. Mostly stuff from Brazil and Africa anyway. Don't need
to waste any money on that.

In a general sense Amateur Radio depends upon protective legislation in
order to exist... I'm not sure I follow your reasoning. Could you expand on
it a bit?

5347. Packet Hackers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-10 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <74ob4d$5q3@enews4.newsguy.com>
Source record: 21036

The malaise which has affected U.S. Amateur Packet Radio over the last few years has manifested itself in several ways. One glaringly obvious problem is that "running down" our current network in public has become so popular and acceptable in recent years among the "movers and shakers" of Amateur Packet Radio networking.
First the advocates of high-speed, then the devotees of amateur TCP/IP have lined up to sing an unbroken chorus of whining, complaining negativism, all aimed at the Amateur Packet Radio network and it's users. This has been going on for several years now. You don't have to be a motivational phychologist to know that when people hear their own "leaders" regularly disparaging and denigrating their efforts, they will tend to lose interest and lose heart. Sure enough, the quality of our "leadership" has fallen somewhat, and the packet radio community in the U.S. suffers to this day.

The depth of this malaise can also be seen in the pathetic, desperate attempt among amateur TCP/IP devotees to legitimize "radioless ham radio".

These people have discovered that TCP/IP can't hack it as a wide-scale Amateur Radio networking protocol, but they will not let it die a natural, honorable death..
In fact, they are perfectly willing to use the telephone (Internet) for the bulk of their communications and PRETEND it's amateur radio, just so long as they can go on using "amateur TCP/IP"...

Weird, pathetic, and twisted, but true! "Radioless Ham Radio"!?! ;-)

It gets worse...

A sub-clique of these same "hams" are deliberately using Packet/Internet gateways to move Amateur Packet Radio traffic over the Internet instead of over ham radio links. This practice of "Internet Forwarding" serves to "route around" and replace the radio links of our digital network's "backbone" with telephone links needed and wanted only by amateur TCP/IP. The stupid thing about this is that given that these "hams" MUST use the telephone for their "networking system", there still is no rational justification for their vandalism of the existing Amateur Packet Radio network in order to do so.

It's not like Amateur Packet Radio would compete with them for telephone access... No, the competition they REALLY fear is in simple legitimacy. The amateur TCP/IP "amateur telephone" network will never be impressive to hams as long as there is a genuine RADIO-based, global digital network to compare it to. Even LandLine Lids realize that "My telephone is faster than your radio" is not an impressive bragging point among hams. Compared to a real amateur radio network such as we still have, amateur TCP/IP with it's utter, abject dependence upon the telephone is laughable. It's supporters

are painfully aware of this fact. -- And what is their reaction to this?

These people (I won't call them hams again, to avoid confusion) intend to see to it that the existing independent amateur radio network is undercut and dismantled, so forcing hams into an utter dependence upon the telephone and amateur TCP/IP. They are quite aware that hams would NEVER voluntarily do any of these things, so they attempt to FORCE us by working to destroy the packet radio network we have built. They attempt to destroy it from within.

Amateur TCP/IP devotees constantly run down the packet radio net, say the BBS forwarding network is no good and that the average packet user is a dope.
Then, these same people insist on being a "part" of that same BBS forwarding network.?.!.? Then, it turns out that their "amateur TCP/IP BBS" stations use telephone links instead of radios, which cause existing ham radio links to die off while ensuring that new radio links do not come online...

Get it?

Their goal is to eventually leave packet ops NO alternative to amateur TCP/IP
and "radioless ham radio", and this represents the first really serious attack upon Amateur Radio in it's history. The heart of Amateur Radio - Communication by Radio - is being seriously attacked.

If you examine the rhetoric of "Internet Forwarders", you will hear many references to "advanced technology", and the "new links" they provide..
To understand where they are coming from, simply replace those phrases with "the telephone"... This is no exaggeration!

That's ALL amateur TCP/IP has to offer; Without the telephone, it's a dead duck. Not lame; Dead.

There IS NO global amateur TCP/IP Radio network. None at all. These people want to tear down all that we have proudly done with radios, HF, H-S VHF/UHF,
AMSAT, ect, and have NOTHING to offer in return except utter dependence on the telephone for the bulk of our communications.

They kinda missed the general point of Ham Radio, if you get my drift..
It's not just that we use radios.. We use radios and we don't deliberately do things to lessen the enjoyment of other hams. In other words, we at least pretend to be gentlemen, sincerely devoted to furthering the cause of Amateur Radio.

The idea of deliberately destroying the existing global amateur radio digital
network, to replace it with telephone links is not my idea of advancing amateur radio, folks.

The idea of using the telephone to "route around" the dedicated hams who have moved our messages with radios so that their efforts and expertise are

no longer wanted or appreciated does not strike me as gentlemanly conduct, either. It's a deliberate action which most assuredly has lessened the enjoyment of many really great hams. Most of these displaced hams are BBS SYSOPs, by the way... Routed around with telephone links, and rudely cut out of the BBS message forwarding network by thoughtless anti-ham-radio LandLine Lids whose final aim is to destroy the Packet Radio BBS network altogether.

That's right; The pioneers of the Amateur Packet Radio network who have done the very most to bring about it's amazing development and worldwide growth are now being rudely displaced by a sub-clique of anti-ham TCP/IP Lids with telephones. Disgusting.

Several suggestions for eliminating the "LandLine Lid" problem have been put forward. The most popular idea is to simply cut them out of our forwarding links by refusing to communicate with them. I don't feel this will prove to be effective. It won't really eliminate the problem, and it will do nothing to prevent future problems. The temptation will tend to increase rather than decrease as Internet access becomes more commonplace... Let's nip it in the bud right now.
My personal leaning is toward a formal request for protective legislation against this specific problem, such as several other countries already have in place. Where Packet/Internet gateways are simply illegal, they have no LandLine Lid problem of course, and their Amateur Packet Radio networks have continued to advance and grow while ours has been mired in this "radioless ham radio", amateur TCP/IP mess which has actually REVERSED our growth.
If we demand and obtain similar legal protection, the Amateur Packet Radio network in the U.S. will never again be menaced or endangered by LandLine Lids of any description, TCP/IP or otherwise.

I think it should be fairly obvious that a Radio-Only rule for "*** primary routing and transport of amateur radio network traffic ***" would tend to push us in the desired direction - that of addressing our problems by developing new, innovative ways to utilize RADIOS.
Also, by phrasing the regulation (roughly) in that manner, Packet/Internet gateways would NOT be outlawed, and could still provide a highly beneficial interface and data exchange point between the two networks. They would only be restrained from using the telephone links to transport messages intended for the Amateur Packet Radio network. (Internet Forwarding)

This would instantly transform Packet/Internet gateways from the parasitic liability they are today into an especially important ASSET to the Amateur Packet Radio network, with unlimited potential. You don't hear about these kind of applications right now because they do not fit in with the agenda of our present "leadership". Eliminate Internet Forwarding, and the Packet/Internet gateway will have a chance to mature and develop as an Amateur Radio application, and of course then there will still be an Amateur Packet Radio network for them to interact with and be a part of.
Yes, you heard right; I'm saying that Amateur Telephone is just as big a drag on amateur TCP/IP as it is on mainstream packet. If amateur TCP/IP is EVER to mature and gain any status as an amateur packet radio application,

then "Amateur Telephone" will have to be firmly placed aside and left behind.
We NEED that pressure to solve our problems by being more clever in our use of radios, if we are to see rapid advancement.

As a BBS SYSOP, my suggestion to you is that we take rapid, effective steps to regain our network from these persons. I also would like to suggest that BBS SYSOPs have contributed much, much more to Amateur Packet Radio than all the world's "packet experts" and amateur TCP/IP devotees combined. We, more than any other group are responsible for Amateur Packet Radio's amazingly rapid growth and worldwide utility as an independent, all-ham radio messaging network.

The point: Don't take any crud off of LandLine Lid parasites who don't even HAVE a network.

Don't take any more of being "run down", don't take any more whining complaints, don't take any more vandalism of OUR network!

Comments, fellow Hams and SYSOPs? Don't you think it's about time the HAMS on this network pulled together a bit, so we can get past this problem and resume building and improving our Amateur Radio digital network?

Yes, it does Charles... In a VERY general sense... I tend to agree with
the prior poster, in as much as I don't think you are ever going to *GET*
legislative protection for packet radio... I would suggest finding
a way to make "all RF" packet somewhat more attractive to the crowd you
are trying to woo vs. attempting to alienate them and place a legislative
clamp on their activities... There has to be a better way, and if I
think of it, I'll let you know (before your head explodes and you launch
into a spate of playground drivel, that's me acknowledging that it ain't
an easy problem to solve...)

If it wasn't wouldn't there be any frequencies to use!
There are many companies etc who would do much to get their dirty hand on
many of the ham frequencies.

>clamp on their activities...

I've never seen much point in trying to "woo" Lids. You've seen the sort of pond-scum which has been trying to pester me here. Typical low-character, no-brain LandLine Lids.

> There has to be a better way, and if I
>think of it, I'll let you know (before your head explodes and you launch
>into a spate of playground drivel, that's me acknowledging that it ain't
>an easy problem to solve...)

No, actually there isn't a better way. I go by RESULTS, and the only places on the entire planet which have produced RESULTS in the last decade have been a few countries in Europe which have either outlawed or severely restricted the use of Internet/Packet gateways. The facts are - the facts.

Sorry, but the "facts" do not support your assertion that there is a "better way". When and if you really come up with something, as opposed to just blowing more hot air, be sure and let me know.

I guess we'd call it "Amateur Radio-Telephone" then, huh?

It's amazing how many people miss the point that Hams use Radio. To them, the radio, the telephone, the signal-flags; It's all "communication" to them and they just can't see why anyone would want to differentiate between one form of communication and another.

Part of it is simple stupidity, and in other cases it's just plain old malice toward their fellow Hams. Other cases, of course, are devotees of the old tcpip stuff who lack the character neccessary to understand or care that what they are doing is destructive and hurts their fellow Hams. In fact, the term "fellow Hams" tends to make them uncomfortable or hostile.

They all (LandLine Lids) suck.

Hi All,

I have 1 MFJ 1270B and 1 MFJ 1274. Including an operators manual and
power cubes for each. Looking for $150.00 OBO for the both of them, plus
shipping.
Please E-Mail if interested.

Thanx
Mike

Charles, anyone who disagrees with you, is "pond-scum" and a "low-character, no-brain LandLine Lid". I have been on packet for over 10 years and you are the worst advertisement for it I know. I have never used the internet for packet and never plan to. But your methods to get folks to see your point need a LOT of work. If I were new to packet, you would have already made up my mind that packet wasn't worth the effort. However I will continue on packet and promote it.

Cool! I'll see you on 20M CLOVER then?
No? How about 40M PACTOR?
No? What frequency did you say you would use?
No ham frequencies?
Oh well, sigh ... another "pretender" ... lot of them around recently.
Think they know what ham radio is about, but haven't clue one.

Perhaps someone in his local area could suggest a club that
holds license exams ...

Until you get on air, there isn't any way you can "contribute" other
than blowing a lot of smoke. Get the license, we'll see you on the bands.

Fortunately, the FCC seems to be getting rather weary of the ARRL and
hams in general. With the possible exception of auctioning off UHF/VHF
bandwidth, I think they have very little interest in amateur activities.

That's correct. In fact, my proposal has nothing whatsoever to do with
frequency restrictions.

>It puts the FCC in the
>chair with respect to what I *DO* with information... I don't think I'm
>really very comfortable with that prospect...

It would prevent you from undercutting efforts by Hams to use Radio to
communicate, but would not in any way prevent you from useful,
non-destructive activities involving Packet/Internet gateways.

I don't advocate outlawing gateways because they are too useful. That's
where I differ from the guys in Europe.

Sorry to hear you're so uncomfortable with that.

>Opens a whole ball of
>rather foul smelling wax when the FCC starts coming into my lab and
>saying "You can't connect this piece of hardware to this piece of

Look it up for yourself. I do research for myself, and sometimes for friends, and never for people who are not likely to accept the info I come up with anyway. My advice to you is to first get ten years or more experience operating packet so that you will know what you are looking at, then take a good look at the FlexNet network in Europe. Compare it to what is going on here.

>Is their legislative structure (not to mention available communication
>infrastructure) vastly different than ours? It's just not this simple...
>If you're serious about finding a solution to your problem, you need
>to take these factors (along with a few others) into account...

I have of course taken those factors into account. As a new comer to this discussion, you would do well to keep your ears open and your mouth shut. - You'll learn a lot more that way.
While you're at it, you can start showing a bit more respect for those who DO know what they are talking about.

Your ignorance is your problem, and fixing it is your responsibility, not mine. If I took on the task of educating every clueless jerk who pestered me here, it would rapidly become a full-time job. I have much better things to do. - Like helping out people who really WANT to learn, and who display the type of character and decency that really makes a Ham.

My recent experience has been quite different. The FCC have shuffled the enforcement of Ham-related stuff off onto a new division, and these folks appear to be quite serious about what they are doing. Your comment would have been fairly accurate a few months ago, but not today. Things have changed.

If the FCC showed less interest in doing their duty by the Ham population, only persons who intend to flaunt or break the rules, and screw their fellow Hams would see the situation as "fortunate".

Fortunately, it is exactly this sort of scum the FCC have become so vigorous lately about "cleaning up".

1) TCP/IP is a network protocol.
2) Network protocols do not require "character."
3) Hams using any network protocol do not require anyones approval.
4) Ham radio is a hobby.
5) Ham radio should serve the community with solutions that are reasonable.

I could go on; but, suffice to say, that any person who steps up to the
soap-box and proclaims that they are the end-all of Ham radio purity,
deserves our finest raspberry.

It doesn't seem to matter, Charles, what the topic of discussion is
here.
You've started a thread which doesn't involve the code testing issue and
you proceed with the "I'm an expert and you are an idiot" routine with
those who don't agree with you. Is this the way you run your e-mail
list or did it die from lack of interest?

>1) TCP/IP is a network protocol.

The one currently used by Hams which is, in almost every instance, directly connected with the "Amateur Telephone" sub-cult. You know; The advocates of "Radioless Ham Radio", where you use the Internet or wirelines and then pretend that what you are doing there is "Ham Radio".

>2) Network protocols do not require "character."

Obviously. I have noticed a general lack of character among many of the amateur tcpip devotees I've run across, though. Not all are jerks, of course, but it does appear that a significant number of them are. As a group, the amateur tcpip devotees have stood out among the various derivative groups of Amateur Radio for their isolated, insulated, self-centered, geeky, "to heck with Joe Ham" attitude.

No other group is so exclusive and anal-retentive, and of course no other group has gone to the extreme of suggesting that Hams use the Internet for the bulk of their communications, and "pretend" it's Ham Radio, despite the fact that it edges out Hams trying to communicate with Radio in favor of geeks using the telephone.. All of the other groups of Hams are too intelligent and connected with their fellow Hams to suggest doing something that stupid and low.

>3) Hams using any network protocol do not require anyones approval.

That's right. You will discover though, that if your style of operating lessens the enjoyment of a significant number of your fellow Hams, the approval of others can become very, very important to you.

Run roughshod over your fellow Hams long enough, and you will see - well, take a look at amateur tcpip. Most hams simply do not want to be associated with the whining, socially retarded clowns who go around trying to convince Hams that tcpip is so great that as Hams, they should give up using radios for the bulk of thier communication so that they can use it. Sorry, Steve; tcpip is not that great. It's the latest thing from the 70's, and is just plain sucky over the radio. It doesn't cut it where it counts; On the air.

>4) Ham radio is a hobby.

Exactly. It's a hobby for those who choose to communicate by Radio. When you take the radio out of the act of communicating via Amateur Radio, you take away from Hams who want to communicate by Radio. Not only are doing something which is rather stupid, but also you are doing something which is extremely inconsiderate.

Digital Ham Radio, like "Packet Radio", is a subset of the Amateur Radio hobby you mention above. This means that in Packet Radio as in "digital Ham Radio", the "Amateur Radio" part comes first.

Amateur tcpip devotees try to pass off the idea that "Amateur Radio" is a useless subset of the "Digital Communications Hobbyist" hobby, and so the use of Amateur Radio of course has no precedence in thier thinking. They are not, in other words, really Hams. They either do not know or do not care what it means to be a Ham; The end result is a "LandLine Lid".

>5) Ham radio should serve the community with solutions that are reasonable.

Yes it should. It should serve the community with solution that involve the use of Ham Radio.

Everybody already knows how to use the Internet, Steve.

>
>I could go on; but, suffice to say, that any person who steps up to the

>deserves our finest raspberry.

I don't know anybody who has done that. I will add though, that any LandLine Lid deserves far more than a "raspberry" from their fellow Hams. The usual measures for dealing with a Lid all apply.

That's a matter of personal taste. If it doesn't matter to you, you probably should just not read it at all.

>You've started a thread which doesn't involve the code testing issue and
>you proceed with the "I'm an expert and you are an idiot" routine with
>those who don't agree with you.

Only with the idiots lacking expertise. More than one of them admits to not even being a Ham. I guess they are just here to do the "troll 'n SPAM" thing for thier LandLine Lid buddies. I get to see a lot of that.

> Is this the way you run your e-mail
>list or did it die from lack of interest?

"My list" is doing just as it is intended. You wouldn't know about that though, as it's a "no bozo" list.

>Dave 5H3US, K8MN

Is that a Ham callsign or (as I suspect) a CB call? You by no means would not be the first CB'er to crawl out of the woodwork to defend Amateur Telephone. I get to see a lot of that.

You're going to see what you want to see, Charles, that's for certain.
If someone disagrees with you, even mildly, you toss 'em into the 'LLL'
bucket without actually knowing what they really do with radio. It seems
that you have a *very* simplistic model, summarized as:

1) If someone doesn't agree with Charles Brabham, they must be an idiot.
2) If someone is an idiot, they must be an LLL.
3) If someone doesn't have a callsign, they do not know about communications.

I find it amusing, but not very surprising, that your apparent model
doesn't actually determine who idiots are by actual inspection. Most
people actually try to figure out if someone actually knows that they're
talking about, but you've streamlined that process considerably; say
one thing that Charles Brabham doesn't agree with and *bam* you're in
the "idiot, LLL, troll, pond-scum" bucket. That saves you from being
compelled to engage in anything remotely like an intelligent discussion.
Not only this is economical for you, it also shields your ego from the
trauma of learning, changing and adapting.

Of course, I'm an engineer, and not shrink, so all of the above is IMHO,
of course.

> > Is this the way you run your e-mail

If the irony of this statement is not already overwhelmingly apparent, it
is about to become so...

> Is that a Ham callsign or (as I suspect) a CB call? You by no means would
> not be the first CB'er to crawl out of the woodwork to defend Amateur
> Telephone. I get to see a lot of that.

I assert that most of the "problem" you see is really in your head, because you're applying too-simple a model. Here you go, displaying gross ignorance of common amateur radio knowledge; not only is K8MN a valid American Extra callsign, 5H3 is the international pre-fix for Tanzania. But, true to model, faced with something you don't understand, you immediately launch into an attack, rather than taking the time to learn. This kind of behavior speaks volumes about you, Charles, and goes a long towards destroying any semblance of technical credibility.

Hi,

I've just downloaded the demo version of new AEA/Timewave terminal program, PK99TERM. At first glance it looks quite good, although the demo only runs in Packet, which is a disappointment for me as I'm mainly interested in ARQ modes. However, I'd be interested in the opinions of other users.

Basically what you are complaining about, is that Ham radio isn't the same as it was when Grandfather had these big rigs with built-in heaters, and smelled like something in the oven.

You long for the days when you sat on his lap and he did all the work.

The number one reason that Hams should be experimenting with technology (and technology is more than equipment, it is total solutions) is that we are sitting on Billions of dollars in spectrum. If you can tell us, that if we follow your leadership, that we will gain spectrum, and not lose spectrum, then nows the time to state your case using arguments in Engineering and Capitalist terms.

It doesn't take a rocket scientist to figure out that we are headed for secondary use or actual loss of this spectrum. We can lose what we have in an WARC-Instant. Ham radio spectrum can be gone by the year 2000. We have to show our Governments that what we are doing requires the spectrum we are given. Did I complain when the FCC took our spectrum? No. What the commercial experimenters did (remember, these are "The People" too) was offer me a better solution than Hams could, at a lower price. Now I use old Ham spectrum in ways that I never could, because some Hams said we had to do it in CW or they wouldn't let us use the spectrum. The FCC solved that, they pulled the rug, and the CW people went somewhere else to destroy the hobby.

Is the solution to this threat, that we have radio-only solutions? Should we limit our protocols to layer 2, and have wars over layer 3 and 4 of these protocols?

I do not support that. Radio purity is a losing move in this game.

I've been an advocate and Ham experimenter in digital networking over radio. I've experimented with digital voice (vocoders), and I've been involved in TCP/IP over radio. I also was an user of BBS type systems until mid 1990. At that time the BBS system collapsed onto itself. There is nowhere to go with that technology. Current Hams don't want to interface to a computer that uses anything from the 70's for technology. Anyone who looks at the BBS interface and sees a good thing, hasn't heard of client/server solutions. Just as we don't use punched paper-tape anymore, we shouldn't have to connect manually to transport data.

I've had people say, that unless you had an HF rig, you weren't a real Ham. I've heard them say, that unless you could do CW at 35 WPM, you weren't a real Ham. I've also heard them say, that unless you were an Extra Class, that you aren't a real Ham. I've been through a few

Psychology classes in College, and I can tell you, that this will not work 100% of the time. It is easy to get Americans indoctrinated, and submissive. One has to only look at the Democratic party, and their appled techniques of working the elderly, and movie star votes, as compared to the Republicans working with Capitalists.

On the one hand, the Democrats have great success, while the Republicans can't get their shit together. Here's the deal: you have to have a voting block of "sheep" to win. Capitalists, like Engineers can't be tamed using the same technology/arguments as someone who fears loss of Government handouts.

If you are dealing with Engineers, or Capitalists, then telling them that they can't hook a radio up to Public Infrastructure, is likely to piss them off, and they'll do it anyway. What you need is a bunch of drooling, oxygen sucking on a hose people, who are just short of death, with their hand on Government subsidies, welfare checks, and senior discounts.

Only then will you get the support you want, in limiting Ham radio to your dream of 1985 status-quo.

I have manuals but cant part with them. I need model numbers and can scan the realtive pages and e-mail them. Duplexing requires altering the switching circuits and the antenna relay. Not very hard to do.

Having trouble getting those last few contacts for your DXCC? Use the Telephone!

It's easy! It's fast! It costs less! It requires no knowledge or ability whatsoever!

Still can't talk to those rare and distant countries on 10 meters, even with an expensive new tribander? Use the Telephone!

Do you have NTS Health 'n Welfare traffic which must be moved top a recipient several hundred miles away? Use the Telephone!

Want to build an Amateur Radio Digital Network? Use the Telephone!

Want to reliably communicate with distant Hams while radiating a minimum of RF? Use the Telephone!

For some strange reason, in every aspect of Amateur Radio except Packet, it is widely recognized that using the Telephone is not an appropriate response to the challenges we face as Ham Radio operators.
Everywhere else, there is an unspoken understanding that as Hams, we are expected to be clever in our use of Radio and in the process of overcoming those challenges, advance the art and better ourselves as persons.

Why is it, I wonder, that the type of information we transmit (Digital as opposed to Analog) makes any difference in this matter? Why is it "OK" to bypass and undermine the use of Radio by Hams who want to transmit Digital info, but not "OK" to do so for Analog stuff?

Is there a particular reason why advancing the art of Amateur Radio in respect to moving Digital info is deemed to be of less importance to us as Hams? Is there any logic behind the widely-held perception that as long as you are handling Digital info, it doesn't really matter (As a Ham) whether you use Radio to communicate or not?

In places where the regs specify that non-ham means of communication not be allowed within the Amateur Radio Digital Net, there has been unchecked progress and advancement over the last decade.
In those places where the use of Packet/Internet gateways have not been regulated though, the opposite has happened and Network infrastructure has been severely compromised while Hams have lost interest and heart in large numbers. This is what has happened to the USA, Australia, and other places where "packet hackers" have been given a free hand to do as they wish.

I have read about FlexNet nodes in Europe which regularly handle 10 Megabytes per hour and more of traffic. That represents a high level of both

physical and technical development and advancement, along with a high level of interest and enjoyment among the individual Packet ops there.

The difference is infrastructure. Use the Telephone instead of Radio, and infrastructure is what you give up. Sure, it's a challenge to build a digital network; It's expensive, difficult, frustrating, and sometimes appears to be impossible. The alternative though, is the mediocrity which follows those who prefer to cop out, cheat, and cheapen themselves while they undercut others.

I just don't see why our response to the challenges we face as Hams should be different when wanting to move Digital as opposed to Analog information.

I do not see why Hams using Radio is treated as being less important in the US than it is in Europe.

No, Charles, I do not. I expect all hams to understand callsigns, since
they're universally applied by international treaty and such knowledge
is required in the licensing process.

I also expect all hams to have the emotional and intellectual maturity to
check facts before flaming.

You've grossly failed on both counts in this example.

By the way, it took less that 30 seconds with http://www.hotbot.com/
to find out that 5H3US was indeed K8MN living in Tanzania. Not only
do you not understand amateur radio callsigns, you're apparently not
very adept at using easily-available Internet resources. If this
alone wasn't enough, you also have a propensity to flame that which
you don't understand. *That's* the breaking point, dude.

> If you have no intelligent arguement regarding the issue I raised with
> "Packet Hacker", maybe you should back off and give the more serious people
> a chance. All you appear to be interested in are character attacks,
> flame-baiting, ect.

I've already agreed with you, in public, that reliance on non-radio
networking reduces one incentive to develop competent radio networking.
Nonetheless, use of non-radio WAN connectivity does in fact foster the
development of local radio networking communities where there otherwise
would be none, something you consistently ignore. In other words,

"Amateur Telephone" has an up-side you fail to address in your diatribes.

Note carefully that the very term you often use "Land Line Lid" is nothing more than a character attack, so please reserve your naive hypocrisy for someone else.

You particularly attack the use of TCP/IP among radio amateurs, for a variety of political reasons. Perhaps the biggest "problem" with TCP/IP is that it has become the most widely deployed non-proprietary protocol in the world today, due to unprecendented interoperability. In the real world, interoperability is high goal, because it allows maximum flexibility. The fact that amateurs can easily internetwork using IP is a testament to the strength of this protocol, and not something to condemn. This does not make IP technically superior, perhaps, but it does explain why it is as popular as it is.

In other words, the "issue" you repeatedly bleat about in public is not nearly as simple as you'd like to portray it. Indeed, the "issue" you bleat of is mostly your bleating, which is why it attracts few reasoned responses. Responding to emotional diatribe with reason rarely leads to resolution, in my experience.

> Grow up or buzz off.

Right, this is your standard response to anyone that dares to disagree or criticize you. Frankly, you've worked to earn criticism, and ignoring it won't change that. I won't be buzzing off, you'll have to understand.

>Correct me if I'm wrong, but don't you support legislative protection
>(as it exists presently) for Morse code?

That was my point as well. Amateur Radio exists only due to "protective legislation", although I see the term "enabling legislation" to be just as accurate in describing the effect.

It is my hope that the legislation or rulemaking I am proposing will *enable* the Ham Digital Net in the USA to overcome it's current slump and start developing again. To understand what I am proposing, please pay careful attention to the following:

I propose that Packet/Internet gateways be restricted from being set up to use one network to move traffic intended for the other. I am not suggesting that the two networks be prevented from exchanging information, or that gateways be outlawed altogether as has been done elsewhere.

This will serve to outlaw "Internet Forwarding", which has severely crippled and depleted the once vigorous Amateur Packet Radio infrastructure in the USA, and will also prevent inevitable problems with inappropriate material such as advertisements, business communications, and pornography finding their way into the Amateur Radio Digital Net if traffic intended for the Internet is allowed to be regularly routed over Amateur Radio links.

This will NOT prevent Hams from using a Packet/Internet gateway for passing APRS data, for example, TO the Internet for use by special web sites, or from downloading "massaged data" FROM the same Internet web site to distribute locally via Packet Radio.

Hams would also use gateways to:

Exchange weather/skywarn data with the NWS, FEMA, ect.

Access Callbook data, download software, Read PART97, and a number of other things which cannot be described because the idea of making web-sites especially tailored for use as an interface to Packet Radio is still in it's infancy. Only a select group of APRS guys and a few digicam experimenters have tinkered with it, so far. The logical first choice, APRS/SkyWarn, is also just barely getting started. This is the "bleeding edge", for those who are into being in on the ground floor of something big.

My point: Do as we have been doing, and we can expect the results we have been getting. Do as I say, and not only will the Digital Net in the USA revive and grow again, but the Packet/Internet gateway will be a vital, integral part of that growth.
All I am asking is that the action which has been identified as being detrimental to our interests be restricted or ruled out. -- I am not interested in throwing the baby out with the bath water, eliminating the good as well as the bad to be found in this new tool, the Packet/Internet gateway.

The most important incentive of all: "Learning how to use and advance the use of Radio".

>Nonetheless, use of non-radio WAN connectivity does in fact foster the
>development of local radio networking communities where there otherwise
>would be none, something you consistently ignore. In other words,
>"Amateur Telephone" has an up-side you fail to address in your diatribes.

I do not address that "fact" because it is not a fact. In *fact*, the widespread reduction of infrastructure the non-radio WAN connectivity "solution" has saddled us with, in combination with the defeatist attitude behind the entire concept of "Radioless Ham Radio" has served to dishearten and disgust so many Hams here in the USA that the Packet network here is in serious danger of collapse. Nodes are dropping like flies in some parts of the country, after having been "routed around" by Non-Ham links such as the Internet and "wormholes".

To see a big, fast, highly advanced Packet net, just go to where the gateways have been restricted. It's that simple. Amateur Packet Radio is a subset of Amateur Radio, and not the other way around. The "Radio" part is not optional. That's why for Hams, using Radio is the best bet, *particularly* if, as Hams, doing so faces us with an interesting and difficult challenge. Hams who are protected from the negative side of Packet/Internet gateways have faced their challenges as Hams should - With Radio. They did not give up and use the Telephone as has happened in the USA. They have great results to show for it.

>
>Note carefully that the very term you often use "Land Line Lid" is
>nothing more than a character attack, so please reserve your naive
>hypocrisy for someone else.

It's an accurate description of a new, unusual type of Lid which Hams have not had to deal with before.

The LandLine Lids are responsible for their own character development, or lack thereof.

>
>You particularly attack the use of TCP/IP among radio amateurs, for

>a variety of political reasons.

I call it sucky performance with Radio, so bad that without the Internet (Telephone) as a crutch, it is a dead duck. That's why only TCPIP devotees insist upon "Amateur Telephone". - Because TCPIP can't hack it as a wide-scale Ham Radio protocol. It's the latest thing from the 70's.

To heck with politics... I look at performance and on that scale, tcpip sits at dead last for Hams..

>Perhaps the biggest "problem" with
>TCP/IP is that it has become the most widely deployed non-proprietary
>protocol in the world today, due to unprecendented interoperability.

Is that why it is absolutely useless for use by Hams for wide-scale networking with Radio?

Is that why it has to be "propped up" with the telephone?

FlexNet doesn't have to be propped up with the Telephone.

>In the real world, interoperability is high goal, because it allows
>maximum flexibility. The fact that amateurs can easily internetwork
>using IP is a testament to the strength of this protocol, and not
>something to condemn.

Amateur TCPIP is great for exchanging data and information between the Ham Digital Net and the Internet. That's as far as interoperability really needs to go, in this case.
Beyond that, TCPIP has proved to be a poor performer for Hams, particularly difficult to set up and operate properly. I suggest we keep amateur tcpip for linking up to the Internet, but forget using it for much of anything else. It's too backward in design and poor in performance, when compared to what Hams have developed for themselves - in those places where protective, enabling legislation ensures that they face the challenges of Ham Radio instead of trying to weasel their way around them with the Telephone.

It's not surprising that the Hams in Europe who stuck with using Radios ended up being years ahead of those in the USA who gave up on radio, threw up their hands, and turned to the telephone for the bulk of their communications. Personally, I find this situation to be embarassing. I'd like to see it rectified as soon as possible.

> This does not make IP technically superior,
>perhaps, but it does explain why it is as popular as it is.

For use by Hams for communicating globally by Radio, it is technically inferior to most, if not all of the other Packet networking systems available. The BBS "store 'n forward" system is widely derided by TCPIP devotees, for example, but you know what? It works, globally, using nothing but Ham Radio. What works can be improved.

>

Last I checked, people were still putting up autopatches. People distribute DX messages via the Internet. People even rant about Packet problems using the TCP/ IP networks. Other communication media are part of ham radio. You won't get any bonus multipliers during Field Day, but if you ignore the facts you just look like a Luddite.

> Everywhere else, there is an unspoken understanding that as Hams, we are
> expected to be clever in our use of Radio and in the process of overcoming

If I really thought this entire packet issue was making you a better person, I'd retract every criticism.

You may be upset that organizations like TAPR have undermined your credibility, but in fact, you've done an admirable job of that yourself. If you feel that you are in competition with other radio amateurs who prefer to use TCP/IP, then so be it. Compete for mindshare with those who prefer to do other things. But do so fairly, without slandering the efforts and motives of others, and providing little technical or economic rationale for your view.

> Is there a particular reason why advancing the art of Amateur Radio in

> Hams? Is there any logic behind the widely-held perception that as long as
> you are handling Digital info, it doesn't really matter (As a Ham) whether
> you use Radio to communicate or not?

There isn't any logic. Most people involved in amateur radio are not interested in traffic handling. Many who are interested in traffic handling aren't interested in automated methods. Packet radio might have been useful in the days prior to fast modems, but it's stagnation at the 1200/9600 baud level has rendered in moot to all but those who have some other agenda. Agendas need not be a negative thing, witness the rise in interest of APRS.

> In places where the regs specify that non-ham means of communication not be
> allowed within the Amateur Radio Digital Net, there has been unchecked
> progress and advancement over the last decade.

Frankly, I get the feeling that in general European hams do better work on VHF. They seemingly lack the HF-centrism which plagues the US ham society. I doubt the regulations have anything to do with it.

> In those places where the use of Packet/Internet gateways have not been
> regulated though, the opposite has happened and Network infrastructure has
> been severely compromised while Hams have lost interest and heart in large
> numbers.

By and large, I think the mainstream of US hams don't think networking is very interesting. The "elite" aspect of US amateur radio is HF operation, and the reason it is elite is because often it doesn't work. This kind of ham isn't interested in building reliable access, because the unreliability of radio makes it "sporting".

Of those remaining, there are some who are interested in digital networking. Many of the most talented are bringing some skill set from the commercial world, where TCP/IP is king. Often these people are interested _applications_ of networking, rather than the network as an end to itself. Interoperability with the commercial internet allows them to use large numbers of pre-existing applications.

The traditional AX.25 network you describe just isn't very compelling. It is very reminiscent of the early days of phone BBSing. It is rather unreliable. It is slow. It has a limited set of applications which are only augmented in a fragmented and slow fashion. If this is the best that amateur radio can pull off, then it is little wonder that hams can be so depressed about the state of packet.

> I have read about FlexNet nodes in Europe which regularly handle 10
> Megabytes per hour and more of traffic. That represents a high level of both
> physical and technical development and advancement, along with a high level
> of interest and enjoyment among the individual Packet ops there.

In Europe there appears to be a much larger set of dedicated amateur VHF experimenters. Their link speeds are signficiantly higher in most areas than in similar areas of the US. This probably has a great deal more to do with it than anything else. Flexnet by itself doesn't do much to enhance packet operations if you don't have enough capacity in the first place.

> The difference is infrastructure. Use the Telephone instead of Radio, and
> infrastructure is what you give up. Sure, it's a challenge to build a
> digital network; It's expensive, difficult, frustrating, and sometimes
> appears to be impossible. The alternative though, is the mediocrity which
> follows those who prefer to cop out, cheat, and cheapen themselves while
> they undercut others.

The current packet setup in the US would be flattered by the term "mediocrity" it most areas. No addition of 1200 baud AX.25 links is going to cure that.

>73 DE Charles Brabham,

For as long as I can remember, ham radio traffic handling in earlier modes (SSB, CW and AM) was often completed by using a telephone. And sometimes even snail mail. This is not a new concept to rely on commercial services hooked to ham radio. Another example is of course the phone patch and autopatch, again telephone based. So what's the big deal on using the telephone with PACKET?

And why shouldn't PACKET (or a PACKET network) be left to sink or swim on it's own merits? If it can't compete with the internet, or being hooked to it, no matter what method any ham dreams up, so be it. Ham radio in general is also feeling some negative effects of the internet competition. But ham radio, like a free market, will still be better off with minimal regulation, not more...

Just wondering why you don't have this same attitude toward CW. Why
cannot Morse code "be left to sink or swin on its own merits?"

>73, Cecil, W6RCA

It can. I'm on record in several posts that I really don't care how it all comes out. And I've predicted several times that the code test requirement will eventually be eliminated. That's just a prediction though, not because I'm pushing for it.

You have to be a CW self tested ham (ARRL's ridiculous definition) just to talk to me, so you see in a way the test will continue...

(But even though I'm on the fence, I like to take jabs at some of the assertions on both sides.)

5416. 'soundmodem' on 100MHz Pentium LINUX box?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-14 00:00:00 UTC
From: John Mock <kd6pag@qsl-nojunk.net>
Message-ID: <87n24pc2ml.fsf@mongrel.kd6pag.ampr.org>
Source record: 20792

I've gotten an ARIA sound card to come in 8-bit Soundblaster mode from inside the kernel (and also as a module), and built a kernel with AX25 code, 'soundmodem', etc. enabled. I know it can put out DTMF tones well enough to dial the phone. Other than making cables and an open-collector driver for RTS to control PTT, is it basicly ready to talk 1200 bps AFSK (or 9600 G3RUH FSK if i can find a suitable rig)? No doubt, i'll eventually figure it out for myself. But could someone tell me if it's ready to go, some minor things need doing for, or whether i need an Elmer to get on the air?

-- KD6PAG ("Networking Old-Timer, RF newbie")

[n.b. My first serious project after getting my license was a homebrew Macintosh AX25 driver (in CommonLisp, no less), and had street-level maps for a several quads of the Bay Area when everyone else was doing maps mostly by hand. So this isn't your usual 'newbie' question.]

Yep, that's the only way to do it, but it certainly runs nice and quick!
A tip for anyone who uses a BPQ to BPQ ethernet link - force the
connection to run at level 2. It will go very nearly twice as fast as if
you let it use a Netrom connect.

>>73 DE Charles Brabham,
>
>For as long as I can remember, ham radio traffic handling in earlier modes
>(SSB, CW and AM) was often completed by using a telephone.

That's correct, if you are talking about NTS. Amateur Radio is used in that context much as it works with MARS, in that a limited form of communication is offered to non-hams, under circumstances where the normal means of communication are not functional, or are unavailable for some reason. Amateur Radio provides the primary means of communication in both of those cases, with the messages being delivered as closely as possible via Amateur Radio, before non-Ham means of communication are used to complete the final delivery. Since NTS and MARS traffic is often directed to non-Hams, it is not practical to attempt to send each message entirely via Amateur Radio.

Hams generally use Radio when communicating with Hams. I thought everybody knew that.

If you are trying to imply that non-Ham means of communication are used for anything but a very minor percentage of the total distance those messages travel, then you are full of farina.

The NTS system has been a credit to Amateur Radio for years, providing health 'n welfare communications during times of disaster, and maintaining a reliable "backbone group" of experienced Ham Radio communicators who are available to assist in many ways, whenever needed.

Do NOT compare what these fine Hams have done for Ham Radio with the vandalistic antics of the "LandLine Lid" community, who have "routed around" and undermined the efforts of countless Hams who were trying their best to communicate by Radio for years now. You should be ashamed of yourself.

> And sometimes
>even snail mail. This is not a new concept to rely on commercial services
>hooked to ham radio. Another example is of course the phone patch and
>autopatch, again telephone based. So what's the big deal on using the
>telephone with PACKET?

The "big deal" is that it has turned out to be extremely detrimental to the maintainence and development of an Amateur Radio digital network... But you

don't really care about Hams using Radio to communicate, do you?

>And why shouldn't PACKET (or a PACKET network) be left to sink or swim on
>it's own merits?

"To hell with Packet." Yes, your interest is obvious. You have
demonstrated how much you care about Hams and Ham Radio.

>If it can't compete with the internet, or being hooked to
>it, no matter what method any ham dreams up, so be it.

If using the Internet instead of Amateur Packet Radio (within the Packet net) kills off Packet, then those thousands of Hams DESERVE to be left with no alternative to the Internet... Thanks for demonstrating the reason why I regularly expect advocates of "Amateur Telephone" to be of low character. You'd make a good "LandLine Lid" poster boy with the anti-Ham attitudes you so readily display.

Since the Internet is not an Amateur Radio network, using Ham Radio for it's communications, there is no way it can "compete" with the Ham Radio digital net. The two networks are entirely different in almost every respect, having very little in common. Both do different things which the other cannot do. Both are different things that the other cannot be.

Some people who formerly were interested in Packet have moved on to the Internet, and others have stayed. Still more have become interested in Amateur Packet Radio in the USA, found out it was really just a parasite hanging off of the Internet's butt, and then lost interest in Ham Radio altogether. Can you blame them?

Hams have gotten together to pool the funds, sweat and expertise needed to set up and operate a Packet node or BBS and improve the US Packet net, only to find that thier traffic is being siphoned away by Non-Ham links provided by LandLine Lids. Without the traffic, they soon shut down and are not replaced. The state of Texas, for example, is currently in a state of chaos because of the short-sighted use of Non-Ham means of communication. Their "plug" got pulled, and now they find that they have nothing. Prior to the utilization of those Non-Ham links, I was able to connect over 600 miles of existing, operating Ham RADIO Packet networking. Now all of that is gone, "routed around" and superceded by the TexNet clowns, and now that their plug has been pulled they have left Texas Hams with - absolutely nothing.

Anybody can use the Internet, and the non-Ham access is light-years ahead of anything Amateur Radio can legally offer. That's the facts of life, like them or not. It's not going to change anytime soon, due to the uncontrolled nature of the info to be found on the Internet. Hams have standards of decency, and it's extremely unlikely that they will give them up for something so common and cheap as Internet access.

>Ham radio in general
>is also feeling some negative effects of the internet competition. But ham
>radio, like a free market, will still be better off with minimal
regulation,

>not more...

That turned out not to be the case. It sounds good, but unfortunately the facts do not support your "less regs is better" approach. (Anarchy won't cut it with Ham Radio, sorry.)

For example, the restrictions against the use of Non-Ham means of communcation to move Ham Radio traffic in Europe forced those Hams to seek and find solutions involving Radio, while US Hams with no such legal protection found their efforts being short-circuited and "routed around" by Lids with cheap Non-Ham links through the Internet or from commercial communications outfits.

They are always so gratified and surprised that the commercial mmunications outfits will provide them "free" fibre-optic links or internet access. If I were a telco and wanted freqs currently used by Hams, I'd be glad to do anything which would get the Hams off of those valuable freqs, including offering non-Ham "connectivity" to those who are weak-minded enough to think that by accepting such offers, they are "advancing" digital Amateur Radio.

i did it when they first came out. i saw the demo at dayton that
kantronics had set up and decided it would be a cool way for me to
alert and send messages to my deaf daughter when she is outside
playing. (using the vibrating mode of course)

let me tell you how i went about doing it.

1. had to get the proper chip for the 9612. at that time it required
an upgrade to do amateur paging.

2. had to use a 9600 baud ready 2 meter radio. i used an alinco data
radio factory setup for 9600 baud only. (paging only works on the
9600 baud port of the 9612)

3. got the motorola pager (alpha/numeric model) and traded the guy at
the beeper shop the original 900 meg board for the 150 meg board.
144 meg boards are only used in austrailia and extremely hard to come
by. but 150 meg commercial boards work well.

4. got the xtal from kantronics for the 2 meter frequency. (cant
remember which one it was now, but it was an unused packet freqency in
my area.)

5. pager guy swapped boards and netted xtal for free.

6. had to put radio on service monitor and play with the levels until
it worked well with the pager. (it only worked marginally) i was not
happy with the 2 meter operation.

7. if i had to do it over again. i would have gone to the 440 band
and used the tekk data radio. far better setup i believe.

good luck.

> ruined the enjoyment of hundreds of other hams with their activities.

Honestly Charles, grow up. If these people are really ruining packet radio for you, perhaps you should consider a different way to spend your leisure time. If this argument doesn't work on you, perhaps you consider what a negative view you spread of amateur radio (and packet operation in particular). Have you ever wondered how many (hundreds?) of other hams you may have ruined with your continuous negativity?

Mark

Charles, face it. You opened your mouth, stuck your foot in, and chewed in right up to the knee. While I was unaware that Mr. Heil was operating from Tanzania, I did have some suspicion that the alternate call listed was indeed a foreign callsign, probably a rare one. By opening your mouth to slander someone without checking basic facts, well, I guess we all pretty much expected as much from you now...

> Grow up or buzz off.

Wise words. Too bad you haven't heeded them.

The secret is to create a second hardware profile and use "Remove from
specific configuration" to hide the port from Windows. If you use
"Disable in this hardware profile" then you'll get problems.

There are some "step by step" notes on configuring BPQ with Win95/8 on
my web page. It's a copy of something that I once sent out on the UK
packet network. The link is not all that obvious! Look for WIN98BPQ.TXT
on the main page.

Herewith some procedures on how to make WinAPRS image files for Great Britain.

Developers, please feel free to include this in your documentation.

[GBIMAGES.TXT]

==========
WinAPRS IMAGE Files for Great Britain.
How to generate them from the Attica GB Ordnance Survey Interactive Atlas.
==========
Version 1.0
by Ian Wade, G3NRW
email: ianwade@netro.co.uk
12 December 1998

Introduction

This How-To document describes in detail the procedures for creating image files of Great Britain that are compatible with WinAPRS (version 2.2.2 or later).

Basis for the images is the Ordnance Survey Interactive Atlas of Great Britain, published on CD by Attica Knowledge (UK tel 01908 570109). The current release of the CD is the "Third Edition", costing about GBP 80.00. However, the procedures described here relate to the "New Second Edition", which was distributed free of charge with the UK computer magazine "Personal Computer World" in November 1998.

Overview of the Process

The basic steps involved in creating image files are as follows:

1. Install the Atlas run-time files on your PC.

2. Start running the Atlas from the CD, and display the map of the required area on the screen.

3. Note the Lat/Long coordinates of the top left and bottom righthand corners of the displayed area.

4. Save the displayed area in a .BMP file.

5. Convert the .BMP file to a .GIF file, ready for use by WinAPRS.
The procedure described here uses Microsoft Paintbrush and
PowerPoint to do this, but other conversion methods are probably
suitable as an alternative.

6. Using a text editor, create a .GEO file for the image. The .GEO
file contains "tiepoints" that relate the top left and bottom
righthand corners of the image to pixel coordinates on the screen.

7. Save the .GIF and .GEO files in the WinAPRS IMAGE directory. They
are then ready for use.

Installing the Atlas on the PC

This is a normal install process. Insert the CD into the drive, click
on INSTALL.EXE, and follow the prompts.

Running the Atlas

Click on the "OS Atlas" icon, wait for the (somewhat annoying) intro
sequence to finish, then click on "Maps". A map of the whole of Great
Britain will appear.

Now click on the green up-arrow next to the "Controls" button in the
bottom lefthand corner. This will expand the picture to completely
fill the screen. THIS IS *ESSENTIAL* -- you can only obtain accurate
coordinates when the picture occupies the *WHOLE* screen.

Now double-click on the map at roughly the center of your desired
image -- this will zoom in one level to the new center. Then use the
+ and - icons on the compass rose (bottom right), together with the 8
green arrows around the compass, to maneuver the image to exactly how
you want it.

Noting the Lat/Long Coordinates of the Corners

With the image displayed as you want it, now move the cursor to the
very top lefthand corner of the screen, watching the Lat/Long display
(alongside the compass rose) at the same time. As you push the cursor
hard into the corner, you'll see the Lat/Long display freeze. Make a
note of the coordinates at this point
(e.g. 52 deg 23.9 mins N, 1 deg 25.4 mins W).

Now push the cursor hard into the bottom righthand corner, and note
the coordinates there (e.g. 51 deg 32.1 mins N, 0 deg 26.7 mins E).

(N.B. Before doing this for the first time, drag the compass box
slightly away from the bottom righthand corner. Otherwise you may not
be able to accurately measure the Lat/Long coordinates there).

Saving the Displayed Map

To save the image, click on the "Print" button at the bottom of the screen. A pop-up menu appears. Click on "Save to File". Enter a suitable .BMP filename (e.g. HOME.BMP). This file can go in any directory (e.g. \TEMP).

You're now finished with the Atlas. Close it by clicking first on the green down-arrow next to the "Controls" button. This reduces the display to its original (start-up) size. Then click on the yellow arrow in the bottom lefthand corner of the window -- this closes the Atlas down (eventually, after 3 annoying screens of Credits :-(

Copying the Saved Map to the Clipboard

It's now necessary to copy the image to the Clipboard, ready for use by PowerPoint. To do this, start Paintbrush, and open the image file saved earlier (i.e. HOME.BMP).

Move the cursor to the bottom righthand corner of the image (scrolling if necessary) and make a note of the pixel coordinates there (these coordinates are displayed in a box at the bottom of the Paintbrush window). For example, on my 800x600 display, these coordinates are displayed as 799,599. You'll need these coordinates when creating the .GEO file later.

Now hit Control-L to Select All, and Control-C to copy the image to the Clipboard. Finally, close Paintbrush.

Creating the .GIF Image File using PowerPoint

Start PowerPoint, and paste the image you've just saved into a new (blank) drawing. Save the drawing as a .GIF file (e.g. HOME.GIF) in the WinAPRS IMAGES directory. (After supplying the .GIF filename, PowerPoint may ask if you want to export every slide in the presentation -- click on "No"). Close PowerPoint.

Creating the .GEO File

Before creating the .GEO file for the image, a little bit of math is needed, to convert the Lat/Long coordinates of the corners of the image from degrees/minutes to decimal degrees. [A simple calculator or BASIC program is all you need here].

For example, using the Lat/Long coordinates mentioned earlier:

Top left: 52 deg 23.9 mins N, 1 deg 25.4 mins W
= 52.39833 deg N, 1.42333 deg WEST

Bottom right: 51 deg 32.1 mins N, 0 deg 26.7 mins E
= 51.53500 deg N, 0.44500 deg EAST

The decimal degrees need only be expressed to 5 decimal places.

**** BE VERY CAREFUL TO NOTE WHETHER THE LONGITUDE IS WEST OR EAST.

Now, using a text editor, create a .GEO file in the WinAPRS IMAGES
directory (e.g. HOME.GEO). On the first line of the file, enter the
filename of the .GIF image file. Then on the remaining two lines of
the file enter the screen and Long/Lat coordinates (note the reversed
order) of the top left/bottom right corners of the image.

WinAPRS ignores lines starting with the # character.

For example, HOME.GEO will look something like this:

```
#~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
FILENAME HOME.GIF
#~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
# screen long/lat
# ~~~~~~~~~ ~~~~~~~~~~~~~~~~~~~
TIEPOINT 0 0 -1.42333 52.39833
TIEPOINT 799 599 0.44500 51.53500
#~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

NOTE: 1. Degrees WEST are entered as NEGATIVE numbers.
2. Fields must be separated by TABS.

That's it!

Proof of the Pudding

To use the image, start WinAPRS as usual, then pull down the Window
menu and select Image Files. Click on HOME.GIF, and the image should
appear.

Before using the image in earnest, it's a good idea to check its
accuracy, by moving the cursor to known locations (e.g the corners)
and verifying that the Lat/Long coordinates displayed at the bottom
of the window are correct.

After you've created a few image files, you'll quickly see if you've
made a mistake. If the image has the wrong aspect ratio compared with
others you've made (e.g. it's too wide or too deep), you've almost
certainly made a mistake in the .GEO file -- using the negative
sign for easterly longitudes is a favorite!

Below is the message I sent to TimeWave tech support. If any one in this group can help I would greatly appreciate it. Thank-you in advance

Rob Kling

TimeWave Technical Support,

I am looking for programming information for the DSP-2232, like uploading a modem into the RAM. More specifically how to create such a modem. The source code for the PROMS would probably work. I would be willing to sign a non-disclosure statement. I have a fast connection to the internet so any electronic information is desired. You do not have to selective when it comes to content, I am fairly able to wade through technical material. Or if you have some publications that you have been working on that may or may not be complete I would like those too. If you have some formal publications that you charge for please let me know how to order those. I am looking for anything!

I'd like to thank all of you for your support of my recent proposal to restrict the use of Packet/Internet gateways so as to eliminate some problems associated with them and to enable Hams to utilize them in a more useful, widespread manner.

A few disgruntled LandLine Lids blatted off personality attacks, a few blathered some selections from their list of mindless catch-phrases, but nobody made any serious arguements against what I had to say.

I'll take the lack of significant disagreement from the LandLine Lids, along with the messages from Hams who agree with what I am doing and encouraging me to continue as a general vote of confidence.

Thank you!

After reading all this debate about packet, land-lines and trolls, I have to say this as
a bystander:-

1. If you want Packet to survive why dont you try to improve the
packet infrastructure ??? (set up more high speed 64 KB + backbones at UHF and higher frequencies)

2. Develop better (DSP modem or packet) software and make it available through with free source code like GNU or free software foundation like arrangement to everyone. (instead you see crappy and inefficient protocols like FSK being sold as propreitary software without source code.
Case in point is RITTY, (this implementaion of crappy FSK protocol seems to be excellent but,
no Source code is provided, plus, the writer has encrypted the runtime code.
(It self decrypts at runtime and does its trick.)
Now, contrast this to the situation where the writer would have provided source code
under GNU like arrangement, everyone would have been able to look at the DSP source
code and learn how to improve the software, and improve their general skills to write
such software and develop better protocols, and in general advance the state of packet radio.)

3.AGAIN, Develop better (DSP modem or packet) software and make it available through with free source code instead just pissing around.
A good example is KA9Q. Do you see him cribbing about Land Line LIDS ??? NO.
Because he is busy writing 1200 BAUD QPSK modem for HF. ANd, he will make the source code
available to everyone.

4. You great radios are nothing but which provide (noisy) channels for use in communications over a shared invisible media called the ether. The most efficient use of this media is when you use it
to for datacomm. Every other form of communication can be sent over as datacomm. Voice can be coded using 2400 BITS per sec using the CELP algorithms.
Datacomm is what it is about.
Learn about channel coding, FECC, DSP, and how to write software to use these channels for datacomm.

HINT: Buy the DSP56002EVM or DSP56307EVM kits and start writing some good DSP code,
instead of whining. BUY some good digital communications books like "Bernard Sklars" book.

Charles Brabham (n5pvl@texoma.net) wrote:

: >
: >A pretty simplistic view of the problem Charles... (Im not being an
: >ass, Im just being forthright...) Which countries in Europe?

: Look it up for yourself. I do research for myself, and sometimes for
: friends, and never for people who are not likely to accept the info I come
: up with anyway. My advice to you is to first get ten years or more
: experience operating packet so that you will know what you are looking at,
: then take a good look at the FlexNet network in Europe. Compare it to what
: is going on here.

Charles, Im giving you an opportunity to provide the information to the
group as a whole... I'd say that you perhaps have a valid argument if
we were exchanging this argument via email... I would think you would
welcome this opportunity to publically share what I would assume to be
relevant information with myself and others that are concerned...
I strongly question your motives in this case... I smell a rice bowl
being held VERY VERY closely for any number of reasons...

: >Is their legislative structure (not to mention available communication
: >infrastructure) vastly different than ours? It's just not this simple...
: >If you're serious about finding a solution to your problem, you need
: >to take these factors (along with a few others) into account...

: I have of course taken those factors into account. As a new comer to this
: discussion, you would do well to keep your ears open and your mouth shut. -
: You'll learn a lot more that way.

It is not readily apparent to me that you have. Also, I will choose my
own learning style. Thanks for the advice, but I see VERY fit to question
you with regard to this. If your "truth" can't stand the light of day,
Charles, might I suggest you keep it in a dark room...

: While you're at it, you can start showing a bit more respect for those who
: DO know what they are talking about.

Something I might suggest to you, Charles. My respect is earned. Most people's
respect is earned, not given freely. I do not WANT the respect of people
that give it as freely as you might be suggesting here. You want my respect,
big guy, earn it... (apparently you do, as you're chastising me for not
providing it here...) I make it a point, in my "doin's" Charles, to never
bow to anyone that professes himself an "expert", especially prior to his
actually PROVING it... Bowing to such a person diminishes me *AND* him...
(I also refuse to turn my back to someone that gives me any form of respect

without me having made an effort to earn it... It's just not wise...)

: Your ignorance is your problem, and fixing it is your responsibility, not
: mine. If I took on the task of educating every clueless jerk who pestered me
: here, it would rapidly become a full-time job. I have much better things to
: do. - Like helping out people who really WANT to learn, and who display the
: type of character and decency that really makes a Ham.

An attack on my character from a man who has never met me. Interesting.
Like wind through gauze, Charles. I would like to reiterate, that I am
far from being a "clueless jerk", but that I am indeed someone that is
making a contribution to the digital communication community, Charles...
May I ask, what have YOU done, besides run a BBS?? You don't appear to
have actually done anything with respect to making a technical contribution
to "FlexNet"... Is this the case?

: >
: >: >I would suggest finding
: >: >a way to make "all RF" packet somewhat more attractive to the crowd you
: >: >are trying to woo vs. attempting to alienate them and place a
: legislative
: >: >clamp on their activities...
: >
: >: I've never seen much point in trying to "woo" Lids. You've seen the sort
: of
: >: pond-scum which has been trying to pester me here. Typical low-character,
: >: no-brain LandLine Lids.
: >
: >Yeah... Short memory... I was one of the "scum" last week... Notice that
: >Im still trying to participate, and that Im looking for answers...

: Still looking to make smart-assed comments, stir up trouble, and make an ass
: of yourself by pestering and denigrating the people who ARE qualified to
: discuss the matter. Proud of yourself, are you?

Well... Since I did none of the above, even under minor duress from you,
I would say, yes, I have managed to deal pretty well thus far. (You might
want to go back and thumbnail the number of times youve threated me, called
me names, etc... It's pretty impressive so far Charles...)

: >
: >: > There has to be a better way, and if I
: >: >think of it, I'll let you know (before your head explodes and you launch
: >: >into a spate of playground drivel, that's me acknowledging that it ain't
: >: >an easy problem to solve...)
: >

Well... Just call me John "Kalman Filter" Wiley...

: >: No, actually there isn't a better way. I go by RESULTS, and the only
: places
: >: on the entire planet which have produced RESULTS in the last decade have
: >: been a few countries in Europe which have either outlawed or severely

: >: restricted the use of Internet/Packet gateways. The facts are - the
: facts.
: >
: >Really? Which countries? Don't you think you're being a little
: restrictive
: >here in making a statement like this?

: Sorry if you find working with the facts to be too restrictive.

I see no facts, Charles... Sorry... If there are a "few" countries, how
long does it take you to type the names in?? I'd like to know who they
are... Im showing a genuine interest here, and you're crapping all over
the place, blowing smoke, and avoiding actually providing any real "facts"...

: >Do you have any actual references/
: >data to back this claim up? I'd like to see it... (Im not being an ass
: >Charles... If you've got it, trot it out, and let's do something
: constructive
: >with it aside from namecalling...)

: It's called the FlexNet network. It covers most of Europe. Kinda hard to
: miss.

OK... Now, which of the countries in "most of Europe" offer legislative
protection to packet radio?

: >
: >: Sorry, but the "facts" do not support your assertion that there is a
: "better
: >: way". When and if you really come up with something, as opposed to just
: >: blowing more hot air, be sure and let me know.
: >
: >Heh. Always close with an insult eh Charles... I won't dignify this with
: >a response... It's childish... Fortunately, I believe in "entering with
: >form, followed by exiting with form"... This kind of nonsense and posturing
: >doesn't solve any kind of problem...

: Sorry that you see a call for solutions which are supported by the facts as
: "nonsense and posturing". Don't feel bad though, as lots of other LandLine
: Lids appear to have the same problem.

1) I am not a "Landline Lid"... (Im not a Ham... I don't run a "gateway"...)

2) The "nonsense and posturing" statement refers to your behavior, Charles,
not your "call for solutions"...

3) Im answering your "call for solutions" as professionally as I possibly can
especially given that your responses demonstrate a strange lack of
professionalism, "character", and "decency"... Are these
characteristics only extended to a subset of people you encounter
Charles? If so, the Japanese have coined a special name for that...
It is not considered a "nice" name... It's one thing to talk a good
game about "character" "decency" or "honor" Charles... It's entirely

another to apply them... Not being one to give a man advice about
the path he walks, that's all I'll say about it...

: >Since Im interested at this stage
: >of the game (being a newcomer to this forum), in determining whether or
: >not the problem you are carping about even exists... (IOW, Im gathering
: >facts) I'll continue to view you as a resource... (BTW, I can come up
: >with PLENTY of cases where the "facts" didn't support solutions to problems
: >which eventually were found... Modern rocket powered flight for
: instance...)

: Yes, pretend that you are seriously considering the matter. That's fine.

Oh... OK... I'll do that, and you continue to pretend you're trying to
solve the problem... (That's called posturing... Anytime, now, you're going
to realize that I am genuinely interested in examining the problem...)

: >Kindly afford me the luxury of being an "engineer" and trying to exercise
: >a little structured problem solving here vs. simply trying to polarize
: >people into a forced and short lived solution...

: Well, hopefully someday you'll figure out what you're talking about.

Heh... Yeah... Someday... You're right, Charles... However (and you'll find
this kind of amusing I think), my system of spiritual beliefs finds this to
be one of the greatest compliments you can GIVE ME... (Short of it being said
that Im a good "Uke"... Which is an honor Im also striving for...)

I wouldn't even claim that I know what IM talking about WRT digital
communication. I do know a little about it, but I get farther and farther
away from being an "expert" every day... It's a very large field...
Very rich... Just love engineering though...
Love building things... It's neat... Very nice to have
a parallel vocation and avocation... I consider myself very lucky... Thanks
for finally showing a little personal concern about me... It's refreshing...

Best Regards and Happy Holidays Charles,

-jw

>etc.

Roger, I tried all that as I used to have it under win95. It seems
win98 is much more active in reallocating p&p devices and com1 and 2
are p&p on the motherboard. For P&P devices when disabled in a
profile win98 in conjunction with bios reallocates. I have overcome
the problem by fitting an extra non p&p fast serial card. All works
well now with bpq in netrom mode talking to the matrix and two TheNet
X1J4 tncs. I plan on adding a third now but to reduce the loading on
the main pc I will put a multi-port shared IRQ card in an old machine
(I still have the bpqcfg for that) and let that handle comms. It
would be nice if winpac could talk to bpq via my ethernet network.
Did you build in code to allow that :-) Messy way is to have bpq on
both machines just to allow the pentium to talk to the old box.

5437. PK-Term 99 Preview 1.2a Update on the web.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-14 00:00:00 UTC
From: Creative Services Software <support@cssincorp.com>
Message-ID: <u60lIG6J#GA.56@upnetnews03>
Source record: 20988

Creative Services Software and Timewave Technology have released an update to PK-Term 99 Preview 1.2.

Release 1.2A supports added features for the DSP-232 and DSP-1232. This is in conjunction with Timewave's closeout of the DSP-232 special.

PK-Term 99 now includes a radio button, to choose which radio port is used on the DSP-232 and DSP-1232. Also included in this update are some minor fixes to the HF settings pages.

As with all CSS products, updates of the 1.x product are FREE. You only need purchase once and any update until 2.0 is released is free to the owner of the product.

The update is available at http://www.cssincorp.com/pkterm and http://www.timewave.com.

PK-Term '99 is available in demo mode off the web, and can be turned into a full version with the purchase of a serial number and activation key from Timewave. The suggested retail price of PK-Term 99 is $69.95.

5438. Need 2 serial ports out of one

My laptop has one serial port. I need *two* serial ports, for data comms use.

Can anyone point me to a suitable hardware/software combo (homebrew design or COTS) that will let me implement this cheaply under DOS and/or Windows 95?

Because of existing applications software, it is important that the two serial ports can be addressed as COM1 and COM2. High speed is not essential -- 4800 fixed on each port is OK, and no control lines (RTS etc) are required, just TD/RD/ground.

Anybody use or planning to use one of these for packet? Any details
or ideas would be appreciated.

I suppose it's possible in theory, at minimal (hardware) cost. Perhaps
Macintosh SoftKISS could be ported to the Pilot and then a minimal AX25
implementation developed for same. Hmmm, actually, SoftKISS + APRS would
probably be a really nice combination... But for now, i'm busy trying
to get a LINUX box on the air.

-- KD6PAG ("Networking Old-Timer, RF newbie")

(n.b. My first serious project after getting my license was a homebrew
AX25 driver (in CommonLisp, no less), and had street-level maps for a
several quads of the Bay Area when everyone else was doing it mostly
by hand.)

>and reallocate IRQ4 etc. I tried slowing down to 1200 bd. If left
>running I can receive on BPQ but it wont connect. If I boot to
>'command prompt only' all works perfectly at any speed.
>Richard G4BBH

I've been running BPQ under Windows 98 for about a week. Before then
it was running under 95. Running much better now.
I found that by using oddball IRQs that Windows would leave the ports
alone.
I used 10 and 12 for comm 3 and 4. Didn't have much choice. The only IRQ
left here now is 5 (can't decide on what to do with it).
After trying 3 different hardware/windows combinations I got 3 different
reactions
to the way Windows handles the ports. From going into the PnP setup (bios)
and
wiping the ports, to enabling them every time the computer was rebooted.
The combination I'm using now won't even try to enable a standard com port
that I disabled in Device Manager. It used to under 95.
The problems I had with another (newer) computer was something like you have
and I think it has something to do with the PnP BIOS setting in the device
manager.
Maybe ticking Disable NVRAM / ESCD updates could help. Or even get rid of
the
PnP device driver completely. It was a real headache when I wanted to play
with
Flexnet and Windows kept going into the PnP bios settings and it would
completely
disable the devices that I wanted Flexnet to use. A bit of a pain when
Windows
disabled the LPT port that I was using for PTT. The outputs went into a high
state
and PTT would go active on rebooting the computer. This was when using
different
hardware profiles.
I've since confined my Flexnet tests to my DOS computer.

That's OK Charles... If I really want you to see what IM posting,
I'll be sure to create myself a new account... :-)

You are probably one of the most thickheaded individuals I've ever
met... Qualified... Yes... I am... Genuine interest... Yes... I
have... It amazes me that you can judge my "qualifications" without
ever having seen them... Now... It's time for me to hop up on
my soapbox, Charles...

Admittedly, I took offense at your "must be a ham to participate
here" nonsense... I have been quite honestly trying to get useful
information from you regarding your "call to action" for the last
two days, and have been met with nothing but abusive, threatening,
and downright annoying responses...

Frankly (and I find this to be rather unfortunate), if your cause
is worth working on, I think you've probably lost more than *ONE*
person over the last few days (as Im sure others would like the same
information I've requested), not a few of which I am sure HAVE
Amateur Licenses... You don't even *TALK* a good game regarding
"character", or "upstanding" behavior Charles... Go get yourself a
decent dictionary, and start by looking those words up... I don't
think those words mean what you think they do...

Best Regards...

-jw

From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <755f74$d8v@enews1.newsguy.com>
Source record: 20798

I avoided conflicts by running BPQ in the Win95 machine, using a single ethernet card for 'BPQ and no Com ports. I did not use the WinBPQ stuff, but ran BPQ normally, along with a term program in a DOS window. This way, when I was not running Packet, WinBPQ was not there eating up system resources and the computer could be used to it's full potential.

After installing the ethernet card, I carefully avoided letting Win95 set up and recognise the card. Thereafter, Win95 ignored the card on bootup. As a result, only 'BPQ was aware of the card's existence, eliminating any possibility of device conflicts, ect. It was fast, trouble-free, and reliable.

I have not tried this with Win98.

Cross-posted to: comp.sys.palmtop.pilot,rec.radio.amateur.misc,rec.radio.amateur.digital.misc

I've put together a small program that runs on Palm computers that
does the following:

- does Ohm's Law calculations,
- calculates the length of a dipole antenna,
- displays the resistor/capacitor color code, and
- displays the QRP calling frequencies.

Granted, it doesn't do much right now, but this is only release 0.1,
and I plan on expanding the number of utilities it offers in
subsequent releases. The purpose of this release is to see if there's
any interest out there in such a program and get some feedback for
features to implement. As hams, we all know how useful feedback can be.

A description of the program can be found at:

http://qtb.com/danr/hru01.html

as well as a link to download the program.

>Hams generally use Radio when communicating with Hams. I thought everybody
>knew that.

I'm glad you used the word *generally*. Judging from the length and
frequency of some of the posts and posters, the internet is catching up...

>"To hell with Packet." Yes, your interest is obvious. You have
>demonstrated how much you care about Hams and Ham Radio.

I tried Packet, and your right, I didn't care for it. But that has nothing
to do with my feelings for hams or ham radio. Spock would say "illogical".
But I think Cecil has a good point here. Why should any mode have any
protection? CW will really take a hit when the test goes away, but is a
government regulation fair to save CW any more than it is fair to have
government regulation to save Packet? If you're really pro-code test and
pro-packet regulation that does seem *illogical*.

>If using the Internet instead of Amateur Packet Radio (within the Packet
>net) kills off Packet, then those thousands of Hams DESERVE to be left with

Ah name calling rears it's ugly head. Don't have an argument? Then name call
to cloud the issue. It's not just Packet the Internet might hurt, but all of
ham radio. If nobody comes to the ham radio party because the Internet party
is more fun then so be it. But please lets not have the government regulate
to support parts or even the whole hobby. (Minimal control regulations
excepted of course.)

Just a quick not about the dsp232 that timewave is selling off at $100.00.
I talked to a very nice fellow at timewave this morning. According to him
he has the bugs worked out of the packtor & wefax modes. We might be
expecting a firmware upgrade sometime in the future....73

One last question Roger. If I put the ports and bpq on an old 286 /
12 and get the network card up and running to bpq on the Pentium do
you think the 286 can handle it (in dos of course)?

5457. Kenwood TH-D7A 24hr review

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-15 00:00:00 UTC
From: Walter Dunckel <wdunckel@best.com>
Message-ID: <3676FED3.70407D1D@best.com>
Source record: 20811

Saw the TH-D7A, and had to have one. Here are a few things I have
noticed since I purchased it 24 hours ago.

In all I am very happy with my purchase. There is much I have to learn,
as this radio is very different from my Kenwood TH-28a. Here are some
things I have liked and some I do not like:
Nice things:
1. There is a separate GPS and PC port!
2. Menu driven (will probably be nice once I get used to it)
3. Backlit Keys (as well as display)
4. 118 to 136 operation in AM AND FM! (This will work well with a
2.4G
downconverter I have!) (136-173.990 and 400-479.975 receive)
5. Digital squelch control. At first I thought I would not like
this,
but even its default setting seems to work great. I love not
bumping this with my thumb, and having to re-set it all the time!

Unexpected Things:
1. Radio did not come with a schematic! This is a big no-no in my
book!
2. Manual seems a little sketchy, but perhaps this is because the
radio
has so many functions??
3. I thought I would be able to monitor raw packet data through the
radio, but this doesn't appear to be the case. I appears to only
view APRS information. (The APRS info can be viewed many different
ways, and is very well done - considering the limitations of
display size and pixels)
4. Cheesy belt loop - looks like I will break it within a year or
so.
5. Although not very close to the size of a brick, it is similar in
shape. I like the shape of my ol TH-28 a lot better, but then I
don't have a 9.6volt battery in it!

If any of you have any questions about the radio, I will attempt to
answer them. Also if any other owners have any other comments, or find
any transmit/rec mods, I would love to hear of them.

If you've got Windows 95/98 or NT, PK-Term '99 will work in demo mode for your 2 meter DX cluster. Demo mode supports vhf single port packet mode with none of the advanced features of the program. It's basicly a cut and dry host mode interface with each session in a seperate windows.

And demo mode is free for the lifetime of the product and does NOT time out. You can also upgrade to the full version via Timewave for $69.95.

Grab the demo from http://www.cssincorp.com/pkterm

Works the same in Win98.

Running that configuration on several machines at w0rli
and Duane (n7qdn) is also running the same configuration.

Add a version of NOS in a Win98 (or 95) window, and your
Windows applications will work fine over ham radio.

Email, web servers, newsgroups, all that stuff.

No internet connection involved, just ham radio ... <smile>

Needs two ethernet cards in the Windows machine (one for windows,
one for NOS), but they are so cheap it's no big deal.

Maybe the Land Line Lids will give it a try sometime, instead
of continuing to claim it "cannot be done via ham radio."

Lots of us just do it anyway ...

Well I was told by the tech that answerd the phone the he had ALREADY fixed the Packtor and Wefax modes. Its a software problem and not hardware. Some enterprising person sooner or later will in all likelyhood repair the defective code. He said "There will be a firmware upgrade". I assume that the statement on the webpage is to avoid HAVE TO. He said he needed to look at the mailbox issue. Its bad code there is bound to be more than one source for new code.

Because most radio hams like to stick to old technology and are afraid of anything that's newer than about 10 years old. Witness things like CW, RTTY, 1200bd packet etc.

>2. Develop better (DSP modem or packet) software and make it available through
>with free source code like GNU or free software foundation like arrangement to
>everyone. (instead you see crappy and inefficient protocols like FSK being sold
>as propreitary software without source code.

Yes your about right there - better packet software. There's discussion on here about how crap TCP/IP is when layered onto AX25, but AX25 is crap anyway! Why on earth can't there be a seperate protocol for 'networking' that doesn't botch onto AX25? - and why not make it a 'two-way' protocol so when mail-forwarding the return ACK packets can be followed by data in the same transmission. That would help reduce traffic by about 10%.

>3.AGAIN, Develop better (DSP modem or packet) software and make it available
>through with free source code instead just pissing around.
>A good example is KA9Q. Do you see him cribbing about Land Line LIDS ???
NO.
>Because he is busy writing 1200 BAUD QPSK modem for HF.

why QPSK? Is that really necessary for 1200bd on HF?

Dj.

If you have a P&P bios then disabling on-board P&P devices (which - for some
reason - includes on-board COM ports) then Win98 will tell the BIOS to
disable the device. Win95 tries to do the same thing - but it doesn't always
do it correctly and sometimes just 'hides' the device from windows rather
than disabling it altogether. It depends a lot on your BIOS as to how
effective this
'feature' of a P&P BIOS works..

>I have overcome

>the problem by fitting an extra non p&p fast serial card. All works

Don't you just Plug & Play! What a wonderful invention that was...

I hope that's not on Packet or I'll be here until the next century waiting
for it..

1200baud - 1960's technology for the moden Ham..

5467. Re: dsp232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-16 00:00:00 UTC
From: rgawtry@timewave.com
Message-ID: <757eh2hqn1@news.minn.net>
Source record: 20821
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc

Jim, Tripp, and others who are interested,

Perhaps I can clarify the situation regarding the DSP-232. After some engineering detective work, some old information from DSP-232 owners, some new new information from DSP-232 owners, some further analysis of some Timewave test data, digging in old AEA files, wading through 100's of kB of DSP-232 source code, some help from my nephew (a super programmer and author of DSP-RTTY), and a lot of dumb luck, I determined that a (the?) major problem with Pactor was caused by an inadvertent "commenting out" of two lines of source code. It's clear that this happened in the rush to get a DSP-232 firmware revision into production during the last days of AEA. As soon as I have time, I will assemble the revised code and burn a new set of EPROMs to test. The key word is TEST! It is not certain that this is the only problem with Pactor; however, one DSP-232 owner has had Pactor operating on the DSP-232 recently using an HF email program that turns control over to the email gateway station in contact with the DSP-232. (The bug changes a "CRTL-Z" command from the operator to a "+?" command sent over the air. CRTL-Z is the Pactor command to switch from send to receive. "+?" is the Amtor command to switch from send to receive.) If the revised code proves itself during testing, Timewave will issue an firmware upgrade.

Some NASA engineers have successfully received HF WeFAX broadcasts using the DSP-232 HF WeFAX mode. They reportedly were using Timewave's WeFAX 256 for Windows software. Timewave has done no debugging of the WeFAX modes. The NASA engineers were using the last AEA DSP-232 firmware release.

The Pactor change is a very small change and does nothing to address any other problems with the DSP-232 firmware. No further debugging is planned to try to fix the such things as the mailbox problems for packet. This is a matter of resources and the fact that other problems appear to be much more complex to solve and test than the Pactor problem. If a serendipitous chain of events similar to the Pactor story should occur, we will certainly try to fix similar types of bugs.

We do not have a schedule for finishing the Pactor fix. It will be done on time-available basis (a lot of the work on the Pactor bug has been accomplished on the 10 P.M. to 3 A.M. "shift"). As soon we have positive or negative info available, we will get it on our website and into the appropriate newsgroups.

Last and certainly not least, a special thank you to everyone who has supported this effort - several DSP-232 owners have put in many volunteer hours.

Randy Gawtry, K0CBH
President
Timewave Technology Inc.

> >use of Radio".
> >
> - like advancing from with boring old plain-text 1200baud AX25? Isn't that
> why TCP/IP became popular?
There is no real meaning in using tcp/ip over packet since the whole
packet network is using ax25.
To use a protocol like flexnet or the new better net/rom works better,
there are enough overhead data sent already.

To use tcp/ip is good when you want to connect different kind of
networks. It makes the network transparent to the user.
But it also requires high speed to be useful and it adds overhead data to
the packets.

> >To see a big, fast, highly advanced Packet net, just go to where the

What?
Tcp/ip will not improve any thing.

> >>Perhaps the biggest "problem" with

> and decided to botch TCP/IP on top of AX25.
There are other protocols, now a days.
In the early days of packet was tcp/ip the only.
Now is tcp/ip packets routed with another protocol, like flexnet.

> >Is that why it has to be "propped up" with the telephone?
> No - that's because the Packet network is so slow and old to cope.
If you want high speeds isn't the telephone lines any alternative.
Modem connections can't offer you high speeds.

A good packet network can.

> Good God man! Flexnet is only a self-adjusting PacLen/MaxFrame system!
> You make it sound like the solution to all the worlds problems:
It is node, packet driver, protocol, networks and much more.

A good node that can be used together with tcp/ip.
The flexnet protocol is much better than net/rom protocol.

The kind of packet drivers and nodes that can handle highspeed packet.

And it is also cheap, the rmnc flexnet hardware is very cheap and good.
Since the rmnc isn't a pc based node is it suitable of unattended nodes.
It is also special designed for node work, with a multitasking that no pc
can offer.

> Tired, listless? - Try FlexNet!
> Money Problems? - Try FlexNet!
It is free.

It doesn't thanks to hf and satellitee links.

> 1200baud - 1960's technology for the moden Ham..
We don't want the packet network replaced by a dial up network i uccp
stile.
Dial up networks isn't really hightech!
And you can't get any thing other than the BBS "store 'n forward" system
work with that.

I have not mentioned any preference for either plain-text or 1200 baud.

Your implication that only through tcpip can packet go any further than
"plain text and 1200 baud" is utterly moronic. Actually, a lot more of what
goes beyond "plain text and 1200 baud" in Packet today goes over ax25.
(FlexNet)

>>
>>To see a big, fast, highly advanced Packet net, just go to where the
>>gateways have been restricted. It's that simple.
>
>Really? Where exactly is this?

Europe. The FlexNet network. Look into it, if you are really interested.
Don't expect me to do your research for you.

If you really do not know anything about packet beyond your piddly little
tcpip LAN, why put on airs as if you were some sort of "packet expert"? If
you want to talk about a global network, you're going to have to lose your
provincial attitude, and drop the chip off of your shoulder. Very few
knowlegable people will bother sharing meaningful information with
narrow-minded snots, too lazy and ignorant to look into things for
themselves.

>

>
>TCP/IP could 'hack it' - the network can't because its so out of date.

Amateur tcpip has been around over ten years that I know of, it's devotees always looking for someone else's network resources to freeload off of. You denigrate the US mainstream packet net, saying it's "too slow", and "too out of date". Let me give you a hint... There IS NO amateur tcpip packet radio net at all, and never has been. - Because amateur tcpip devotees are big on talk and mighty slim on results.

The mainstream packet net performs infinitely better than the non-existant amateur tcpip digital rf net. That's a fact.

Amateur tcpip has had over a decade now to build that better, faster network we have all heard of so many times. What you morons did instead was blow off using radio to communicate, building a "virtual packet network" up from Internet (telephone) links. You put so much into your simulated network that you bult very little ACTUAL Radio network.

You look kind of stupid up there on your high-horse, denigrating the very network you end up freeloading off of.
But that's one of the common LandLine Lid traits. Run down the work of other Hams, while doing nothing themselves.

>>
>>To heck with politics... I look at performance and on that scale, tcpip
>sits
>>at dead last for Hams..
>
> - just beind straight AX25 that is..

Sorry, but that turns out not to be the case. The "performance scale" that counts for Hams is "how well does it work with Radio?"

Demonstrate the HF tcpip network which would exist is tcpip were at all efficient for use with Radio.

>
>>>Perhaps the biggest "problem" with
>>>TCP/IP is that it has become the most widely deployed non-proprietary
>>>protocol in the world today, due to unprecendented interoperability.

>>networking with Radio?
>
>No - it because Hams couldn't be bothered to come up with a better system
>and decided to botch TCP/IP on top of AX25.

Actually, Hams have come up with a number of systems which, under the conditions they are designed to work under, are years ahead of amateur tcpip in their functionality for Hams. A few quick examples are CLOVER, PACTOR for HF, FlexNet, XNet for VHF/UHF, Multicast for HF @WW distribution, and a number of others. All of these will yield significantly better performance than amateur tcpip. Heck, regular old AX25, which you love to denigrate, allowed worldwide delivery of all-amateur radio E-mail through the BBS store 'n forward system. Amateur tcpip has never provided anything along those lines at all.

Do not confuse the performance of the Internet with Amateur tcpip's performance. Like it or not, they are two different things, and when you communicate by Non-Ham means, what you are doing at that time is not "Ham Radio".

>>
>>Is that why it has to be "propped up" with the telephone?
>
>No - that's because the Packet network is so slow and old to cope.

The Packet network which is infinitely faster and better than the one amateur tcpip never built?

>>
>>FlexNet doesn't have to be propped up with the Telephone.
>>
>Good God man! Flexnet is only a self-adjusting PacLen/MaxFrame system!

It's more than that.

>You make it sound like the solution to all the worlds problems:

I don't know about that, but I do know that it's at least a decade ahead of amateur tcpip. I also know that the world's biggest, fastest, most advanced and most heavily used Packet Radio network was built under protection from "Amateur Telephone", and that during that same time, the USA with no such protection has seen it's Packet Radio network decay and decline instead of growing.

Like it or not, there is a direct link between "Amateur Telephone" and the decay of the US Packet Radio network. The same thing has happened in Australia, and a few other places around the world. Only those places with strict regulation of gateways have advanced and built up significant high-speed infrastructure.
What you LandLine Lids tend to do is to TALK about high-speed infrastructure while you use the Telephone. That's why you never built a network. That's why we need to regulate the utilization of Internet/Packet gateways.

>>
>>> This does not make IP technically superior,

>
>Is that the 'store and forward' system that takes a week for your message
to
>travel to the next city?

I'm sure that there are cases where it has taken a week, which is of course infinitely faster than the Packet Radio network amateur tcpip never built.

You LandLine Lids are so funny! Always out to denigrate and run down the work of your fellow Hams, always ready to criticize the work of others, but too shiftless and lazy to actually do things up to your own specs.
After over ten years, the crowning achievement of the amateur tcpip community has been a software triumph.. - They managed to cobble on a few hacked-up, incomplete and incompatable versions of a normal Packet BBS program onto Phil Karn's NOS. Ten years, while other Hams were out busting their butts and their wallets to BUILD the network those silly LandLine lids have the gall to denigrate and run down.

Blowhard jerks.

Okay, Charles, let me ask you why, during my last three years in Finland I never saw any evidence of Flexnet? Finland is the land of Nokia with more cellphone users and internet users, per capita, than anywhere else in the world. The amateur packet system runs 1200 baud (2m) and 9600 baud (70cm). Where is all this Flexnet activity which you claim is sweeping Europe? Let us know the specifics. You've talked the talk. Now walk the walk.

Hi Henry, I am using PKTerm99 with a older PK88 and it works just fine. I use it mostly to connect to the local DX packet cluster and I leave it connected for days at a time with no problems. The computer that I am using is a 386/33 so you do not require allot of horse power to run the program either.

That would be hard to answer, since I do not live in Finland. Although Finland is a great place, I do not think that anybody confuses it with central Europe, where of course most of the action is.

Try http://hes.iki.fi/clusse/ and ask the author of Clusse, the Finnish freeware DX cluster. Clusse is set up to work with either 'BPQ or FlexNet, which would imply that the author had access to FlexNet network. Ask and find out, if it is interesting to you. I'm not interested enough to make it worth my while to pester the author of Clusse. Maybe you are interested enough.

You can kiss my butt with that "walk the walk" horse-hockey. I am not interested in serving as your personal errand boy to dig up any information you may demand. My feeling is that if you "demand" certain info, then you must be interested enough to get off your own can and dig it up.

Personally, I find it to be very informative that after choosing to "debate" this matter for several days, you STILL have not shown enough gumption to look into the facts for yourself. You are quite content to remain ignorant, and petulently demand info from others while you sit on your dead can. I think you just want to argue.

Don't waste my time again with information demands.

>
>Dave 5H3US (a real amateur radio call in Tanzania), K8MN (a real amateur

Excellent! How 'bout adding a feature to predict AO-27 passes
from a given lat/long? Well, ok, that's maybe more than just a
"feature"... ;^)

Well, since most folks wanting it for a Pilot will be operating hand-held,
AOS/MEL/LOS will probably be sufficient (unless you have a serial interface
for your rig and want to automaticly compensate for doppler). So what i do
is write out the 'short form' output of SatTrack (available at AMSAT.ORG
for many non-Microsoft/non-Apple platforms) and then run a modest Perl5
program that writes a file which 'install-datebook' downloads into my Pilot.
If you are close enough to the SF Bay Area for this to be helpful, you may
find a fairly current copy of that file at:

http://qsl.net/kd6pag/AO-27.pilot

That way you can also see some sample output in case you want to 'roll your
own'. That version also reminds about 10 minutes in advance of the pass,
which is invaluable for being at the right place and the right time for
operating hand-held. And, no, it doesn't remind you about evening passes...
grin
73's, good luck, and catch you on the 'bird!

-- KD6PAG ("Networking Old-Timer, RF newbie")

P.S. Skeds welcome to all 50 states and most provinces, for CM87/CM88 and
other 'nearby' grids given sufficient notice. If interested, please compare
http://qsl.net/kd6pag/AO-27.passes with predictions for your own area and
suggest one. (I often can work lower than 10 degrees given enough notice,
but not on a routine basis, so those passes aren't included there.) Weekdays
preferred.

You have not looked very carefully.

Most of the HAMS who take part in this discussion do so on ham radio
not here on the internet. You should look on ham radio for comments
from radio hams <surprise!>

Most of the HAMS who post here on the internet agree with Charles.

A small minority (the "Land Line Lids") are 1) very vocal; 2) tend
to post silly comments with no substance; 3) never address the issues.

Here is an issue for them to address:

Should the ARRL recognize QSL cards for "contacts" via ICQ and other
internet chat mechanisms as valid for awards? If so, why? If not, why?

Relate your answer to the issue of "pretend radio networking" via the
internet.

>>NO. Because he is busy writing 1200 BAUD QPSK modem for HF.
>
>why QPSK? Is that really necessary for 1200bd on HF?

It isn't really necessary, but it works *so* much better than
Bell 202 AFSK that there's no contest. Karn's implementation
works at an Eb/No of 4 dB. That's about 1 dB away from the
theoretical limit for this sort of coding. (By comparison, a
typical amateur Bell 202 AFSK system needs an Eb/No of
about 18 dB.)

Also, QPSK can fit in the same bandwidth as BPSK (it is
basically two BPSK signals orthogonally sharing the same
channel). That means you get twice the rate in the same
bandwidth *without* paying a SNR penalty. This is as close
to something for nothing as you can get with signal design.

Karn uses that extra capacity for FEC, so the recovered
BPS is only 1200 instead of 2400, but that's capacity well
spent because of the much lower error rate achieved.
(1 error in 100,000 bits at an Eb/No of 4 dB.)

Actually, he is using a varient of QPSK called SQPSK.
This has several benefits. 1) It is more robust against
skywave multipath. 2) There are no 180 degree transitions,
so the power envelope only has a 3 dB variation instead
of having a zero crossing at every transition. This means
that the PSD (Power Spectral Density) is well constrained
(sort of similar to MSK in this regard). In other words, the
guard band between channels can be greatly reduced, IE
it is a good spectrum sharing partner.

This is really nice work, and it will run on a 100 MHz 486
or Pentium with a sound card. No special DSP hardware
is required. This is *not* plug and play at this time. You
have to know what you're doing to implement it on your
computer system.

So, let me get this straight, you think you may have found one of the DSP-232
bugs, but you don't intend to look for others. You're selling out remaining
inventory at deep discount, and don't intend to provide ongoing product
support except as a matter of serendipity. So in other words, the DSP-232
is to be an orphan. Okay, sometimes projects don't work out. I can live with
that.

But now the 64 dollar question, are you going to release source under
a non-commercial license, IE GNU style? If so, I'd be interested in helping
lower the inventory level of your warehouse (I'd buy two or three). Otherwise,
I have too much undocumented hardware in the orphanage already to consider
reverse engineering another failed product so I can fix it and put it to work.

I haven't posted for a while but here it goes: I have an ehternet connection to the internet in my dorm room here at Utah State University. I've been tinkering with my packet stuff now that finals are almost over and I was wondering if anybody knows of any windows software that will allow me to do IRC, email, etc. through my computer. I have two TNC's to test it and another terminal. Any ideas? I've been told that Linux is the best way to do it but I haven't the time to try it, and besides that, my computer is a bit temperamental.

I am not a contester, but somehow I think that they shouldn't, given that it
isn't really in the spirit of the radio paintball sports that contesting is.
That is _not_ to say however that having such gateways aren't useful to radio
amateurs. Is it radio? No. It is a useful adjunct to the operations that
hams perform on radio? Almost certainly yes.

5483. Re: Feasibility of Internet Amateur Radio Servers - A Discussion

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-16 00:00:00 UTC
From: John Mock <kd6pag@qsl-nojunk.net>
Message-ID: <87g1afbykt.fsf@mongrel.kd6pag.ampr.org>
Source record: 20837
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

The fact that people may not use the terminology doesn't imply that people don't want the results. People who have used packet radio for long periods of time like me for example don't think that 1200 baud even with rf forwarding is such a big deal. Better than nothing, but it is slow, and it is not always reliable either. You know it, and I note that you don't get

Ain't that the truth. I had a node walker running about 6 months after getting my license (homebrew AX25 driver w/ kit packet modem), the routing metrics aren't great. Certain paths are only intermittently reliable (and often a function of what repeaters share the radio site and the behavior of the users thereof). I basically had to do the equivalent of IP source routing to get from the S.F. Bay Area up into central Oregon, and that was strictly on a good day. This was semi-automated, so i did try it on Field Day one year (there is/was a special provision permitting digipeating and node use for packet on Field Day). I could make the connections OK (even that far away), but nobody was out there to hear my CQs.

on usenet? Most of the hams posting on here have at least one TNC and one radio capable of doing packet, now why do we use the internet instead?

Because 1200 bps AFSK packet is pathetic. It runs about as fast as a Model 33 teletype and is even less reliable. (Those old-timers who have serviced those beasts will better appreciate that remark than most...) 9600 bps ain't alot better. The satellite folks have realized that, unlike the terrestrial packet people, and many of newer birds (including P3D) will be/are 38.4 Kbps. TMSAT has already demonstrated that this works (and its images are such high quality that 9.6Kbps is *much* too slow).

What we need to do is start building compable rigs:

http://www.ee.surrey.ac.uk/EE/CSER/UOSAT/amateur/38k4_receiver_paper.html

describes the off-the-shelf approach using largely off-the-shelf equipment (the key component of which is commercial). There's no reason that someone can't homebrew a compatible device for much less money. The receiver part is immediately useful (given a suitable antenna system) and so you don't have to wait for someone else to have comparable equipment to test it out (worldwide!).

38400/1200 or 38400/9600 should work fine for client/server applications (such as BBSs, nodes and many IP/TCP applications), so a 1200/38400 node could be made which complement the homebrew 38400 modem and use ordinary rigs for the transmit side (to simplify the homebrewing and so hams no

having access to suitable test equipment won't have to worry about Part 97 compliance). And operating full-duplex should significantly reduce the retry problem with AX25 (or IP/TCP at that data rate).

-- KD6PAG (Networking Old-Timer, RF newbie)

P.S. If any S.F. Bay Area folks have an interest in this kind of home-brewing, please send me e-mail!

Gary, it doesn't have to be GNU-style to make the product feasible. I got an orphan sound card running,which the LINUX community had abandoned work on, 'cause supposedly suitable documentation wasn't available from its card's manufacturer(s). But the ARIA folks had licensed an single FTP site for redistribution of its Software Development Kit, associated documentation, drivers, upgrades, etc. So given controlled distribution and a license agreement suitable to both parties, this kind of approach could be practical. As you note, we'll need enough source material to be to burn a replacement PROM and make relevant changes to the associated drivers. But as long as that site is operational, we don't have to redistribute their material amongst ourselves; if the original software base is consistently accessible (or otherwise frozen), then we need only redistribute difference files, which for most practical purposes, would be our own work and not anything that lawyers are going to get upset about or even doing anything about.

As we try to get manufacturers to go back to the source distribution policies of 20-30 years ago, we need to make the corporate property folks confortable about doing this. Asking for a GNU copyright may make them hit the ceiling, as in this case, the much of the same software may be part of current products and could become part of the competition's software under a GPL. I don't even have problems with a symmetric non-disclosure agreement if it just involves for the costs of distribution and it permits me to share my work (not theirs) with others. A slow(er) shift away from a binary-only policy is much more likely to succeed with most organizations (and this one may well be a lot more flexible).

You make claims and assertions yet you back none of them up with fact.
Why not? If you expect anyone to buy into your emotional rants, you
should be able to back 'em up with facts. That you haven't done so
would lead me to believe that you have no facts. Put up or clam up.

> Personally, I find it to be very informative that after choosing to "debate"

Charles, you have no more idea about my knowledge base or my qualifications than you do about packet operation in Europe. You quickly and rudely dismiss others who question statements you've made as if they are factual. You've presented no material to back up your claims.

> Don't waste my time again with information demands.

Something tells me that time is something you have plenty of, Charles.

Exactly.

While Amateurs pioneered MicroSats, they squandered their lead by
spending all their money on an old technology risk.

Use the telephone! Motorola took the microsat to a new level, and
Microsoft want to follow. Hundreds of them in orbit doing with low power
what the ARRL and all the AMSAT folks wish they could do with their
terminally-earth-bound money-pit.

Will somone please launch the God Damned AMSAT satellite, or at
least use the French to destroy it on launch (like all their other payloads)
so we can stop spending money on this pig!

I do not know, but some provider were enrolled for being the contact
to the NIC, and they (the provider) maked trouble when the customer
left them. The customers went to court, and years later they got their
domain back, yes.
Maybe that happens no longer, but who knows.

You are correct, the other TNC's PK-12,88,90,96,900,232,1232,2232 etc are in on compilation source and compiled to a particular target. So development for one TNC carries over to the others.

One more bit of history:

If AEA had used the firmware base at their disposal perhaps the DSP-232 project would have been a success. Instead for reasons that never materialized, They choose to develop all new code. So the firmware could be released in the manner Gary Coffman suggests in another post.

Just a bit more data.

I just bought one. It is worth $100. as-is. VHF 1220 baud Packet, RTTY, CW receive,
HF AMTOR. They have solved the HF sensitivity problem, PACTOR and Wefax seem resolved (minus some features at the moment).

They are planning a CW transmit daughterboard add-on (AEA never designed CW transmit into the box).

Seems to me that this is the perfect Ham device. Enough features to justify the
price, with lots of potential bonus features that will result from Timewave and
others tinkering.

From what I heard, folks had best get theirs now ... when they break through some
of the poor AEA code and design problems (as they are doing quite rapidly) they
will be able to raise the price ... or they may run out of the stock they bought from
AEA! (They had understood that this box was ready to sell and fully functional when
they aquired the stock from AEA in bankruptcy. It was not and the delay in rendering
it fit for sale pushed Timewave into bankruptcy ... but they are roaring back!)

Nope, no affiliation whatsoever with Timewave (well, I do own a DSP-599zx),
just love
it when an small business takes risks, gets burned, recovers, and keeps
innovating!

I have good news and bad news for you:

Bad news first: www.baycom.de was run on a Linux server in the shack of a German polytechnic radio club, where it was connected to the Polytechnic's network. Unfortunately one of the drivers on the system went into amok mode and stuffed up the Polytechnic's network, which led to the termination of this arrangement. So www.baycom.de is no more.

The good news is that the BayCom team have found an alternative host and that the new site will go online soon under the address www.baycom.org. Initially there will be an old backup copy of the site until I have uploaded the last version (which resides on my PC and is still under construction - I polish the English). I yet have to get the details from Germany, so you'll have to be patient for a few days. There will also be an updated version of the pages - I deal almost exclusively with the language side of things and leave the tech updates to my extremely busy friend Johannes "Mr BayCom" DG3RBU.

5498. FBB in the room network

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-17 00:00:00 UTC
From: skoric@uns.ns.ac.YU
Message-ID: <36789774.6C45D1BC@uns.ns.ac.yu>
Source record: 20852

Hello gentlemen,

I plan to make a small computer network in the local school ham club. There will be a packet-radio bbs (server) and one or more computers (clients) for users:

********** **********
VHF <----------* FBB * * client *
* server *LPT <----->LPT* for *
HF <----------* * * users *
********** **********

At the moment all COM's on the server's side are reserved for TNC's and other peripherals but there are two LPT's free. On the client's side there is only one LPT free. Well, I want kids to access the server from the client box in a way as they would connect the bbs via radio. I wonder if I need some special networking software and cable for that purpose. Please note that all boxes are old 286 with up to 2MB of RAM. FBB server is 5.15c version. TNC's are USCC internal modems and external

TNC's. I am not going to do some node networking but I am familiar with BPQ and BPQETHER packages. I tried to use them but discovered some difficulties to set it up with USCC's. I wonder if there is a simple way

to make this network for sending/reading mail and access radio ports.

This is a good example of the stupidity which led me to open up a seperate Ham-Policy list. It wasn't just that Code/NoCode was being ground into the dirt, but it was being ground into the dirt by "debaters" who showed a lot more interest in endlessly arguing than in a productive debate.

Sorry, but I was raised to consider debate as a tool for achieving a wider understanding of the issue by all involved. - Not as an excuse to play juvenile "mental masturbation" games and waste people's time.

Maybe you should see if you can find someone to "master-debate" The Code/NoCode issue with you a few more times. It appears that "Code/NoCode" is all you are really geared up for.

Don't forget to wash your hands when you're through! ;-)

5500. Problem with Winpack 6.42 and Delphi 2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-17 00:00:00 UTC
From: dsfa@mail.islandnet.com
Message-ID: <75b36e$561$1@news.islandnet.com>
Source record: 20854
Cross-posted to: comp.lang.pascal.delphi.misc,rec.radio.amateur.digital.misc

Hello all,

I am posting this request for help in 2 usenet groups:

comp.lang.borland.pascal.delphi.misc
rec.radio.amateur.digital

and it concerns a problem I am having with Winpack 6.42 and Delphi 2.0.

For those reading this in the comp.lang.borland.pascal.delphi.misc, Winpack is a popular application program used in Packet Radio.

For those reading this in rec.radio.amateur.digital, Delphi is a Windows programming language.

The problem concerns dde. An external program I had written worked fine under Winpack 6.40 but not under Winpack 6.42. I wish to know if it's a programming error on my part (quite possible) or a bug in Winpack 6.42 (possible but unlikely), and would appreciate any help and/or suggestions.

I have distilled the problem program to its essentials. Please do the following steps:

1. In a new application, place on Form1 one each of the following: ddeclientconv1, button1.

2. In the property editor for ddeclientconv1 enter the following properties:

DDeService - packet
DdeTopic - winpdde

3. In Button1 click enter the following:

```
begin
DDEClientConv1.ExecuteMacro('Hello', True);
end;
```

4. Save and compile (make sure Winpack is running.)

5. Copy the resulting project1.exe file to the Winpack\Extern directory.

6. Switch to Winpack and type '/project1' in the command line.

7. Under Winpack 6.40, 'hello' appears in the receive window. Under Winpack 6.42 nothing happens until project1 is closed. Then 'hello' appears in the receive window.

8. Another quirk: if project1 is launched off Windows explorer, then it works as expected!

(I have tried this using Delphi 1 with the same results.)

This problem has exausted me. If any Winpack user who is also a Delphi expert could have a suggestion, I would be very grateful.

Even the communication protocol between 68340 and the 2115 would
helpful here. Yes, it could be sorted out in a few days with a logic
analzer, but if it is already documented somewhere, it would be
a tremendous asset. The manual for the DSP-232 references a
technical programming manual for the unit... Does this exist?

I have the first and second versions of the EPROM releases for
the unit. One thing that I've noticed is that the first version
firmware for the DSP seems to be closer to the modem descriptions
than the second. I'm using this EPROM with the second version
of firmware for the 68340 and seem to get better results.

5504. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-17 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <75b8ps$qnt@news.Hawaii.Edu>
Source record: 20858
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6OO, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Can't we simply use a TNC and load a terminal emulation program onto the
pilot or are looking to have the pilot emulate a TNC?

No doubt you could. But it probably won't fit in your packet, run off of
batteries and costs a substantial part of the price of a pilot (as opposed
the homebrew solution, being less than the cost of a Palm serial adapter
cable). Being able to send APRS message from the backcountry has alot of
appeal, as well as showing potential for emergency communications. As it
is right now, the laptop and/or TNC are the dominant power consumers for
such use, and the Pilot consumes much less power than an HT (even on its
lowest output setting).

I'm not familiar with all that FBB will do, but if there is a way to use a PLIP driver (which treats a connection between parallel ports in the same manner as ethernet), that should work quite nicely.

I know that PLIP will work with JNOS, which might be an option. You can get the PLIP driver at ftp.crynwr.com, which also has a large selection of ethernet drivers.

That's exactly how I'm doing it now. Post-processing with
perl lets me weed out the passes below the mountains west of town, for
example. I just always wanted to be able to generate them on the fly
instead of having to remember to do tham in advance before every trip.
I grabbed the gcc-based sdk for the pilot, and had a look at the
sattrack source. Now I'm just trying to come up with the time to
write something. I figure I can just steal the geometry engine from
sattrack and leave out the other 99% (most of the user interface, the
X11 code, etc). If I get *really* ambitious, I might read NMEA data
via the serial port for accurate time and location info. It would be
nice to be able to load in a small table of keps and generate data
whenever I want from wherever I happen to be. We'll see...

You've brought absolutely nothing in the way of factual material to the
table, just a disparate array of claims which you've presented as fact.
Some are obvious falsehoods. You've been abusive to each person who has
disagreed or who has tried to straighten out your "facts".

You bray about debate but you are rude and dismissive to all who don't
share your beliefs. I don't believe you were raised to consider debate
at all.

Charles, you are a loud fool.

Also HF for long haul links using new protocols.
Some of us are in fact doing these things. We don't say much about what
we are doing in this forum because almost 100% of the people who post
here are not actually ACTIVE on ham radio.

But the links we build cannot be used because the traffic which MIGHT
flow over them is sucked onto the internet instead of being allowed to
travel over the RF links. Why bother to build something which will not be used?

In my case, I do it for fun, and don't care if anyone else uses what I build.
And yes, I do give it away, and have done so for a long time.

Some of us are working on exactly these issues. But we cannot test our ideas
because all the potential traffic is sucked over the internet. I'll probably release

some new code next year anyway, even though the only hams who will be
able to use it are outside the US.

>
> 3.AGAIN, Develop better (DSP modem or packet) software and make it available

> available to everyone.

Hmmm ... I already have some fast HF modems, but cannot make use of them
because the traffic is forced to go over the internet. I cannot make use of the
facilities I build.

Yes, this is all quite clear. Some hams have made good livings doing exactly
what you suggest. But the sales are not to hams, they seem uninterested.

> HINT: Buy the DSP56002EVM or DSP56307EVM kits and start writing some good DSP
> code,
> instead of whining. BUY some good digital communications books like "Bernard
> Sklars" book.

For those without the background needed to write DSP applications: get on the air!
There are some very good HF modems available now, and better ones will be soon
available. Oh, but wait, there will not be any traffic for you to handle with your
HF
modems because it is all stuffed across the internet FIRST. But there is a solution
to
this problem. I call it the "Just say no" solution. Build the radio links and use
them.
Refuse to exchange traffic with the "hams" who "play radio on the internet."
Now you have some traffic to handle, and can work on the protocols (at all layers).

Observation: 10 meters has been open a lot recently. There is almost zero digital
activity on that band. I'm there. 24 hours a day, 7 days a week. Anyone want to
try anything on that band? Why aren't hams (for example) busy working on the STA
that will allow the use of CLOVER 2000 on HF? Available now, 2 K BPS or better
in a 2 Khz channel.

The title pretty much says it all. I have 2 1278's that I can upgrade to 1278B's.
OR I can buy a KAM +. Which is better all around for HF? The 1278's have been
on a shelf for a while unused since I hadn't until recently gotten a decent radio to
use on HF.

Please direct any comments to me via email, as my news server is not at all reliable.

Thanks

Are there any tries to use a soundcard to receive the signals?

I doubt if most sound cards have a high enough sample rate. To process a
38.4 kbps signal, Nyquist says you'll need at least twice that in terms of
a sample rate, e.g. about 80 kHz (with good filtering) and most sound cards
operate at the CD sample rate of 44.1 kHz. Maybe an EZKit will run that
fast, but not your typical cheap sound card.

It would be nice to be able to load in a small table of keps and generate data whenever I want from wherever I happen to be. We'll see...

I think you'll need to get permission if anyone else were able to use it, as i don't think the copyright on SatTrack would necessarily allow that. I used to run SatTrack on an early Mac laptop [hint to the Pilot folks: SatTrack is a UNIX program], but got discouraged about going very far with it mostly for that reason (and also because it was generating too much RFI given the antennas and rig i was using at the time).

Actually, I don't do the "multiple post" thing, but do sometimes end up answering them.

There is a "whine 'n flame" newsgroup, I believe. You should go there to whine, and the LandLine Lids can go there to flame.

Once again, the personality attack with absolutely no arguement against what I have had to say is praise indeed. You know I am right and that logic won't serve you, so it's off to whine 'n flame land.

Enjoy!

Hi,

I was just wanting to know if anybody is wanting to sell ANY speed TNC
for around $50 Canadian under $100. Or if anybody knows what some people
are talking about not even needing a TNC "something about a computer to
radio interface" and the software doing the work, somebody told me about
some Baycom TNC; wondering if anybody knows if that's an interface and where
I could get it...Plus I'll buy a Interface if I can get it around $20..
Reason for all this madness is I just got my license and digital radio
packeting is what is of my interest.

Thanks to all,

73 de Steve, VA3ATC

Charles Brabham (n5pvl@texoma.net) wrote:

: It doesn't. You disagreed with me, but at no time did you pester me. Also, I
: have seen no evidence, one way or another, as to whether you are involved in
: "Amateur Telephone" yourself.

: If you'll remember, my reply to your post was to remind you that in a
: general sense, Amateur Radio depends upon protective legislation in order to
: survive. I then said that I didn't follow your reasoning, and asked you to
: expand on your initial statement. You never did, or I missed it.

Following that, I made the point that Amateur Radio doesn't really depend
on "legislative protection" for it's continued existence... You never
answered that Charles... Why do you persist in the comparison of Apples
and Oranges?

: I was implying that if Amateur Radio exists due to protective legislation
: and rulemaking, then as part of Amateur Radio, the new digital modes desreve
: that sort of protection no less than AM, SSB, SS, FM, CW, FM, ect. The
: digital stuff is still a bit new, and I do not see it as being unusual that
: adjustments to their use are still being made, just as they have had to be
: made in the past to make way for other "new modes".

ROTFL... "Digital Modes" aren't NEW Charles... LOTS of people have been
doing digital for many many years... Just because you aren't part of that
particular COMMUNITY, don't make the mistake of assuming that the technology
is "new"...

: Is there really a logical reason why it is less important for Hams to use
: Radio if they are moving digital as opposed to analog info?

More important, I think... It's all analog anyway when it hits the
channel... I think the problem you are having, Charles, is that you
just don't have a big enough pipe... People want to use services that
just don't seem to be provided by your solution...

: Why should the Hams in Europe enjoy protection from the damage and outright
: reversal of infrastructure growth that widespread use of "Amateur Telephone"
: brings on, but not US Hams? Why is it less important for Hams to use Radio
: in the US than it is in Europe?

Again... Please provide the names of those parts of Europe that enjoy
this "protection" you claim...

: Less than ten years ago, a global digital network consisting entirely and
: solely of Amateur Radio links existed. This unique all-Ham network is now

: fragmented and in disarray, and this damage occured because of the lack of
: "anti-hacker" legislation to protect the digital Amateur Radio network from
: the attentions of "digital communications hobbyists", who are really very
: easy to spot. They are the ones who keep insisting that "speed" and
: "connectivity" are more important to Hams than using Radios.

Speed and Connectivity are the two requirements that are often driving
forces in "pushing" things forward Charles... I think I remember you
yammering about that at some point... Which way do you want it?
If Im forced to use a 1200 bps pipe with limited dynamic routing
capability, I think I'll choose to do it better... Whatever that may
mean...

Best Regards,

-jw

Geoff, you are 100% correct. There are many protocols out there, and
they all are fine (I worked on one that used DTMF tones to signal alarms
and provide status), but when it comes to interfacing client-server
applications, or WAN applications, IP is the clear winner.

My company develops software for military and commercial satellites,
and I can tell you we do not use anything Ham related. The satellites
must transport multiple overlayed sensor data from the battlefield to the
National Command Authority from one side of the world to another.

Even General Electric said that all appliances will have an IP address.
That is, a toaster to a furnace will be addressable. That's not to say they
will not use a private range IP address, rather than an Internet one.
GE could make toasters that all had the same IP address, and the
home interface will be a cable modem, telco modem, or satellite dish
which masquerades the whole house.

Ham radio, to be valuable, must have bandwidth to transport bit rates
of over 100 kbps. There are some who advocate "Fog Horn" technology
(conventional wideband), but Spread Spectrum will rule the day in the
coming decade. Commercial FM stations will be as quaint as AM stations
were in 1969. Commercial radio will go to spread spectrum in the next
decade, and anything designed for "Fog Horn" (read that AMSAT) will
be a toy. The NAVY launched a satellite that is designed for spread
spectrum, and the silence about it on the Ham bands and Internet
groups, does little to make me feel that Hams will provide any leadership
in the commercial sectors future.

Our satellite motto: If it ain't IP it ain't shit!

Did I say that? I was simply making the point that TCP/IP is being used
because people like the features it gives.
Can you tell me of a packet program that doesn't use TCP/IP yet allows you
to send 'fancy' mail (graphics and fonts etc.) without resorting to 7+ and
all the problems that brings? or even a program/protocol that allows file
transmission without buggering up the contents of the file or aborting
halfway through transmission?

Well done. No doubt there's plenty of potential radio hams reading this who have just gone completely off the idea of trying packet radio because "Very few knowledgeable people will bother sharing meaningful information". And you wonder why the packet network has died....

>simulated network that you bult very little ACTUAL Radio network.

Oh sorry - I didn't realise that by NOT using tcp/ip personally I had built up a virtual packet network. Actually - that's not bad going now I think about it. I assume that if I continue to not use tcp/ip then it will grow into a virtual global network without be doing anything?

>>>To heck with politics... I look at performance and on that scale, tcpip

Yes there are cases. Very regular cases for me..
>
>After over ten years, the crowning achievement of the amateur tcpip
>community has been a software triumph.. - They managed to cobble on a few
>hacked-up, incomplete and incompatable versions of a normal Packet BBS
>program onto Phil Karn's NOS.

What about Linux? That has NATIVE AX25 and TCP/IP, graphical front end etc.
It's a very easy OS to use for packet. Even Win95 now has drivers that
interface TCP/IP to AX25 - It's called something like... erm.. Flexnet..

>Ten years, while other Hams were out busting
>their butts and their wallets to BUILD the network those silly LandLine
>lids have the gall to denigrate and run down.

Just what EXACTLY gave you the impression that I am a LLL? Could it be that
I dared to criticise the normal non-TCP/IP network? Or was it simply that
TCP/IP was mentioned?

Or perhaps it's just a stock-response you have?

For your information I am trying as hard as I can to avoid having to use
TCP/IP. It's a really naff protocol for radio communication. But many of the
new Hams coming to packet see it as the way forward simply because there's
no real alternative. Most of the local station here have gone over to TCP/IP
and unfortunately I think I'm going to have to join them soon or be left out
alone.

That would only be true if BPS = baud. As telco modems demonstrate,
that doesn't necessarily have to be so.

Good point, I'd forgotten that SatTrack has some fairly
restrictive licensing. Perhaps I could pull the ol' AKCL trick. KCL
(Kyoto Common Lisp) had a pretty restrictive licensing agreement. In
order to build AKCL (Austin/Kyoto Common Lisp), you would set up the
KCL source tree in the normal way, then apply a gargantuan set of
patches that changed about 3/4 of the code, then proceeded with the
build. It kept with the letter of the licensing agreement, though it
blew the spirit of the agreement all to heck. ;^) Or perhaps I could
do the "right" thing and talk to Bester (???) and get permission. The
Palm market is so small, they might just agree to it. Especially
since it would be distributed free and nobody would be making any
money from it... Perhaps in my Copious Free Time(tm)...

For 38.4 _kBaud_ signals you would require about 80 kHz sampling rate.

Is this 38.4 kbit/s satellite downlink signal really two level (38.4
kBaud/s) or four level (19.2 kBaud/s) or eight level (9.6 kBaud/s),
which would determine the bandwidth and sampling rate required.

You might want to take a look at the code written in C by N3EMO
(http://www.amsat.org/amsat/ftpsoft.html#src).

I used is as a base and ported it to Java with no problems ;-)

>I could get it...Plus I'll buy a Interface if I can get it around $20..

For BayCom -type 1.2kb Packet modems, (50bucks) try Tigertronics. They also sell 9.6kb Packet Radio modems for 100bucks or so.

These modems are about the size of an RS-232 gender-changer, and they work just great. Later on, if you get a laptop and decide to operate Packet "portable", the Tigertronics modem will be perfect for that too, due to it's small size. I use on one my BBS. They don't look like it, but they are heavy-duty.

http://www.tigertronics.com

Another alternative, even cheaper, is to use a normal; 16-bit SoundBlaster type soundcard as a TNC. Special free software allows you to do this, but you must heat up the soldering iron or have another Ham help you to build a simple COM port PTT (push-to-talk) interface which uses one transistor, one diode, and one resistor. It cost around three dollars to build. This is a great "home-brew" project for a new Ham.

To look into this, go to my web page listed below, and push the "FlexNet" button. Read "Packet Radio with a SoundCard" first, then read a few of the different "introduction to FlexNet" articles I have collected there.

I recommend that you use FlexNet with either the Tigertronics modem or the Soundcard. You will be using the most advanced stuff available, and it's easy to set up, too. It works great.

I used the word "imply" Look it up, if you don't know what it means.

>I was simply making the point that TCP/IP is being used
>because people like the features it gives.

Actually, they don't. There is considerable amateur tcpip activity in my
area... They seldom if ever do anything you couldn't do better with more
modern, advanced software.

>Can you tell me of a packet program that doesn't use TCP/IP yet allows you
>to send 'fancy' mail (graphics and fonts etc.) without resorting to 7+ and
>all the problems that brings?

Graphic Packet would be my first guess, but from what I understand there is
better software available now. I don't know of anybody in north Texas who
cares one way or the other about transmitting and recieving graphic files
over Packet, so it's kind of a moot point. - Another of those "great
features of tcpip" that nobody cares about.

Most Hams figure it's kind of stupid to clutter up a Packet channel with
that kind of junk, when you can download it all day on the Internet without

bothering anybody or hogging up a freq.

>or even a program/protocol that allows file
>transmission without buggering up the contents of the file or aborting
>halfway through transmission?

I've seen tcpip transfers abort due to poor band conditions just like any
other software will do.

I've used YAPP to transfer files on a number of occasions and had no
problems whatsoever.
There are others around, but YAPP and 7PLUS is all I've had occasion to use.
>

>>Actually, a lot more of what goes beyond "plain text and

>
>Really? Christ help it here when more users go over to tcp/ip then...

Don't worry. It's not likely that large numbers of Hams will be looking to
use the latest stuff from the 70's. Most of them will want to run modern
software instead.

>>
>>Amateur tcpip has had over a decade now to build that better, faster

>It's a very easy OS to use for packet. Even Win95 now has drivers that
>interface TCP/IP to AX25 - It's called something like... erm.. Flexnet..

LINUX is an oddity. - Nothing more and nothing less. It takes a back-seat to
OS/2, which is stsarting to become pretty obscrure.

For Radio users, LINUX sucks due to it's heavy dependence upon the old, inefficient KISS drivers. The hot setup for LINUX users is to run applications in LINUX, then run an ethernet or serial link to a DOS/FlexNet box which handles all of the Radios much better than LINUX can.

>
>>Ten years, while other Hams were out busting

By all means, if nostalgia is your "thing", amateur tcpip is the way to go.

Enjoy!

Hi All,

I have 1 MFJ 1270B and 1 MFJ 1274. Including an operators manual and
power cubes for each. Looking for $150.00 OBO for the both of them, plus
shipping.
Please E-Mail if interested.

Thanx
Mike

Charles,

I disagreed with your proposal for "protective legislation" for the packet mode. I personally think it is a bad idea.

How does that make me "pond-scum" or "low-character"?

Charles Brabham (n5pvl@texoma.net) wrote:

: >>Your implication that only through tcpip can packet go any further than
: >>"plain text and 1200 baud" is utterly moronic.
: >
: >Did I say that?

: I used the word "imply" Look it up, if you don't know what it means.

Charles... Your use of the word "moronic", in this case, is nonsensical
fluff then... You are essentially either...

1) Unwilling to directly call him a "moron" for making a statement
you KNOW he didn't make...
2) Stuffing words in his mouth and then calling him a "moron" for having
said them...
3) Admitting that you actually didn't understand EXACTLY what he said
and calling HIM a moron as a consequence of your lack of
understanding...

Any of the above qualified you for something... Dunno what...

: >I was simply making the point that TCP/IP is being used
: >because people like the features it gives.

: Actually, they don't. There is considerable amateur tcpip activity in my
: area... They seldom if ever do anything you couldn't do better with more
: modern, advanced software.

Such as? What could you do "better" with more "modern advanced software"
that isn't being done... (anyone feel free to chime in... Im pretty
familiar with TCP/IPs shortcomings over SATCOM links and some forms
of RF links, but Im genuinely curious about what you see...) Im sure
Charles isn't going to answer... But this, at least, gives me a forum
to ask the question in...

: >Can you tell me of a packet program that doesn't use TCP/IP yet allows you
: >to send 'fancy' mail (graphics and fonts etc.) without resorting to 7+ and
: >all the problems that brings?

: Graphic Packet would be my first guess, but from what I understand there is
: better software available now. I don't know of anybody in north Texas who
: cares one way or the other about transmitting and recieving graphic files
: over Packet, so it's kind of a moot point. - Another of those "great
: features of tcpip" that nobody cares about.

Why do you think that "sending graphic files" is a "feature" of TCP/IP
Charles? No one ever wants to send "maps" or maybe "weather data" over
a packet network? How about SSTV? No? Interesting... Seems like not
such a bad thing to be able to do...

: Most Hams figure it's kind of stupid to clutter up a Packet channel with
: that kind of junk, when you can download it all day on the Internet without
: bothering anybody or hogging up a freq.

Actually SSTV would interest me a great deal... (and I've all but decided
that Im going to get the Amateur license, JUST so I can yank away the
argument you're sure to make here...)

: >or even a program/protocol that allows file
: >transmission without buggering up the contents of the file or aborting
: >halfway through transmission?

: I've seen tcpip transfers abort due to poor band conditions just like any
: other software will do.

Ahem... There are mods to TCP/IP to alleviate some of this Charles...
Maybe you should do a little leg work...

: I've used YAPP to transfer files on a number of occasions and had no
: problems whatsoever.
: There are others around, but YAPP and 7PLUS is all I've had occasion to use.
: >

: >>Actually, a lot more of what goes beyond "plain text and
: >>1200 baud" in Packet today goes over ax25.
: >>(FlexNet)
: >
: >Not around here it doesn't.

: Of course not. You're stuck back in the 70's with tcpip nostalgia software.
: Hey, some guys still utilize CW too, every day. If it's fun, do it and don't
: worry about being obsolete. That's what Ham Radio is all about.

Hmmmmmm...

<snip>

: >>knowlegable people will bother sharing meaningful information with
: >>narrow-minded snots, too lazy and ignorant to look into things for
: >>themselves.
: >
: >Well done. No doubt there's plenty of potential radio hams reading this who
: >have just gone completely off the idea of trying packet radio because "Very
: >few knowledgeable people will bother sharing meaningful information".

: You forgot the rest of the sentence --- "Very few knowlegable people
: will bother sharing meaningful information with narrow-minded snots, too
: lazy and ignorant to look into things for themselves.

More like... People that are "knowledgable" and lack an enormous ego
(because they are too scared someone will take their toys/rice away
from them) are very glad to share meaningful information with
EVERYONE... Especially those that others interpret as "narrow minded
snots"... That's how they convince people that they are right...
I usually find that people that make these claims are people that
don't really HAVE any meaningful information to share, and they are
simply covering up their own bloated and unjustified ego...

Source record: 20887

I've been on the "advanced" AX.25 packet network that are dribbling data along at 1200 baud and it is pathetic. I develop client server software for a living , and I use networks everyday. Any network that I have to know the network topology to use is just about useless for software development. I tolerated it in the early eighties with bitnet, but then again I wasn't writing very many networking programs at that time. With tcp/ip I can take programs that I have developed for the internet and move it very quickly over to a amateur radio network. That is incredibly valuable in a disaster when an official wants to access data somewhere on the internet, using software that he knows well. IP may not be the best protocol in the world for radio, but it is a defacto standard in the world of computing, and amateurs should not ignore it.

>
>How does that make me "pond-scum" or "low-character"?

It doesn't. You disagreed with me, but at no time did you pester me. Also, I have seen no evidence, one way or another, as to whether you are involved in "Amateur Telephone" yourself.

If you'll remember, my reply to your post was to remind you that in a general sense, Amateur Radio depends upon protective legislation in order to survive. I then said that I didn't follow your reasoning, and asked you to expand on your initial statement. You never did, or I missed it.

I was implying that if Amateur Radio exists due to protective legislation and rulemaking, then as part of Amateur Radio, the new digital modes desreve that sort of protection no less than AM, SSB, SS, FM, CW, FM, ect. The digital stuff is still a bit new, and I do not see it as being unusual that adjustments to their use are still being made, just as they have had to be made in the past to make way for other "new modes".

Is there really a logical reason why it is less important for Hams to use Radio if they are moving digital as opposed to analog info?

Why should the Hams in Europe enjoy protection from the damage and outright reversal of infrastructure growth that widespread use of "Amateur Telephone" brings on, but not US Hams? Why is it less important for Hams to use Radio in the US than it is in Europe?

Less than ten years ago, a global digital network consisting entirely and solely of Amateur Radio links existed. This unique all-Ham network is now fragmented and in disarray, and this damage occured because of the lack of "anti-hacker" legislation to protect the digital Amateur Radio network from the attentions of "digital communications hobbyists", who are really very easy to spot. They are the ones who keep insisting that "speed" and "connectivity" are more important to Hams than using Radios.

Think it through. -- Which is REALLY more important to Hams?

That would only be true if BPS = baud. As telco modems demonstrate,
that doesn't necessarily have to be so.
[ke4zv@bellsouth.net]

Gary, you probably know i know the difference (as i'm usually the one
to make that point), so you must be letting other folks know. Yes, i
would like to explore using different 'constellations' at 4800 baud.
(Folks, please read a recent ARRL handbook for details.) We might to
be able to get four phases shifts and AM on a good RF path with a 9600
baud compatible radio. And that kind of experimentation one reason i'm
trying to get 'soundmodem' working under LINUX. (Are you familiar with
that, Gary? I could use an elmer for that right now.)

But that approach is best done on point-to-point links, and could be
difficult at best in a client-server model (unless the server keeps
track of separate 'trainings' for each station). Of course, we're
supposed to be experimental and try things that the commercial guys
might not be doing. Hmmm, now that i think about it, i'm close to
line-of-sight with another fellow from computer music realms, and
he also has the DSP chops (and hardware) to try some of these things
out.

For 38.4 _kBaud_ signals you would require about 80 kHz sampling rate.

Is this 38.4 kbit/s satellite downlink signal really two level (38.4
kBaud/s) or four level (19.2 kBaud/s) or eight level (9.6 kBaud/s),
which would determine the bandwidth and sampling rate required.
[OH3LWR <keinanen@sci.fi>]

Yes, two level. As noted in the referenced article, that protocol is a
fairly simple extention of the G3RUH 9600 Baud FSK Modem. But i believe
some of the SETI folks are using the faster sample rates and moby FFTs,
so whatever affordable hardware works for some of them may be adequate
for 38.4 bps FSK as used on TMSAT.

Actually, as I'm sure you realize, there is more to communicating on Packet than AX25. FlexNet is described as "an ax25 stack", but that description is not too terribly comprehensive. There's more to it than ax25.

Hey that's great! I'm not certain, but I believe a port of FlexNet to LINUX is also currently in the works.

Here in the US though, most of options seldom see any use. *NOS users are used to KISS, are set up for it already and tend to stick with it when they switch over to LINUX, in order to reduce the number of new things to learn at once.

>
>Of course, I shouldn't have to do your research for you, right?

I appreciate it anyway.

Where can I find the Flexnet protocol specification(s)? I'd like
to investigate the protocol myself.

Do you know where to get hold of the Soundcard drivers for 2400 and 4800?
I wouldn't mind giving them a go...

They are built into the newer kernels, or can be patched into older
kernels. It's an option when configuring the kernel source for
compilation. See the AX25-HOWTO:

ftp://sunsite.unc.edu/pub/Linux/doc/HOWTO/AX25-HOWTO

Been there, done that. All I found was a 6-pack specification in
German. Nothing more than a "motherhood" diagram of the modules
in the Flexnet implementation, and nothing at all that even resembles
a concise description of the Flexnet "on-the-wire" protocol.

Since you're a strong advocate of the Flexnet, I rather expected you'd
have the protocol specification there. The more I look into it, the
more it looks like a proprietary protocol with binary-only distribution.
I certainly hope this isn't the case.

5547. PACTERM 98 Problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-19 00:00:00 UTC
From: xxxtoneri@ils.net
Message-ID: <367b8fad.1132114@news.tor.sfl.net>
Source record: 20751

I just bought Pacterm 98 for windows and the darn thing won't work except in demo mode. I have a valid serial number and activation key which I got from Kantronics and was later verified by them as being correct. The program will not work in any other mode but DEMO. Has anyone else had this problem or can suggest a solution other than sending the software back to Kantronics?
Is there any shareware out there for HF, AMTOR etc or WEFAX that will work with the KAM 98?

Mike,

If you got the serial number and key in email, cut and past that information into the registration box. It must be exact as sent, or the program will continue to run in demo mode and is based on your callsign. This is a common problem if you try to type the serial number and activation key in and miss a number or letter.

I'll be glad to verify the workings of the serial number and kay on Monday when I get into the office and we'll go through it one by one with you.

BTW, PacTerm '98 is the only piece of software that supports the KAM '98 in host mode at this time.

No, I do not have access to anything special. I'm just a guy with a web page. Lots of those.

You've seen the web-site: Have you talked to the FlexNet gruppe? My understanding is that if you present yourself well, and can demonstrate that you are a competent programmer and not just wasting their time, that they are quite cooperative.

I believe you are right about FlexNet being proprietary, with no source code available though. There is a paper available which describes the FlexNet API (Application Programming Interface) but I don't think this is what you are looking for. - Maybe it is!

In fact, now I remember stories about the XNet system being "FlexNet compatable" but then hearing stories about it's compatibility being incomplete, not fully functional. That would follow if the original code was not available.

I don't think the FlexNet folks are ready for a tcpip enthusiast to cut 'n paste the result of thier work, if that's what you are after. My best suggestion in that case would be that you come up with your own code. Hey! It only took ten years' concentrated effort by the amateur tcpip community's pool of programmers to cobble a poor imitation of a Packet BBS into Phil Karn's NOS. At that rate, the amateur tcpip community should be able to come up with a third-rate imitation of FlexNet in, lets say, another decade or so.

Start today!

Dana,

PE1RJA and IW5AWZ have included some flexnet capability in their hacks of
the Linux node software. There isn't an explanation of the protocol
included, but you may be able to glean something from the source code:

ftp://ftp.funet.fi/pub/ham/packet/linux/awznode/

> you are a competent programmer and not just wasting their time, that they
> are quite cooperative.

That's what I'm guessing, too, but that's not very encouraging. If there
is actually a protocol specification, it would be trivial to publish it
via the web. There would be no "waste of time". Engineers like myself
wouldn't have to "bother" asking, we could just download the specification
and inspect it on our own.

> I believe you are right about FlexNet being proprietary, with no source code

> looking for. - Maybe it is!

No, Charles, I was quite specific in my question, I'm looking for the
protocol specification - without a public specification, there's no
way to independently build interoperable systems with this protocol.

By the way, when you make the comment about "wasting their time", you're
apparently unaware that keeping source and specifications proprietary is
a clear invitation to "waste time". Sun figured this out when it made
the pJava and eJava specifications public last year, and now the source
code (!) is being made public, free for download to anyone, regardless of
how well they present themselves. There's still a royalty for shipping
products that use pJava/eJava, but there's no upfront cost to become
part of the development community.

> In fact, now I remember stories about the XNet system being "FlexNet

Yup, it sure would. Incompletely reverse-engineered systems. Talk about
a waste of time.

> I don't think the FlexNet folks are ready for a tcpip enthusiast to cut 'n
> paste the result of thier work, if that's what you are after.

This statement implies a great deal of subjective bias. You were quick
to lecture about the meaning of "implication", please take your dictionary
out and look up the meaning of "specification". I'm obviously not interested
in boilerplating the Flexnet code, I'm interested in evaluating the protocol
and perhaps independently implementing it. That's why I asked for the
protocol specification. Source code of existing implementations is
useful for clearing up ambiguities in the specification, or, in the absence
of a specification, helps to speed the reverse-engineering process.

> My best
> suggestion in that case would be that you come up with your own code.

Why, thank you, Charles. See above.

> Hey!

There's the obligatory ad hom attack. This attack is clearly unwarranted.

Excuse me?? First of all, FlexNet is a set of drivers and an API, not a protocol. The API is documented, but i ca't say how completely. If i i were in the Microsoft world and not the LINUX and i can get someone to talk to at >20 kbps (in the S.F. Bay Area, even), you'd be amazed how quickly i could get something running. The LINUX material appears to be handle a comparable number of protocols, although at this point, the DSP side may not be as complete. But my feeling is that TCP/IP at 9600 bps is a toy and that at 1200 or 9600, ARPS is probably the right tool for most things you don't just start up and look for the results hours later. And that is not to say that AX25 isn't a toy (which is what FlexNet uses as a transport layer) at those speeds as well. (And indeed, APRS and TCP/IPprotocols use the AX25 unnumbered packets as a transport mechanism). If FlexNet were a protocol and there's both enough documentation and a nearby node or three, it'll maybe a week or three (if i'm not busy), not years or decades. After all, i was doing ARPS on a Mac well before MacAPRS came out. They say they've invented a better wheel, but i think packets show fly, not roll...

> capability, I think I'll choose to do it better... Whatever that may
> mean...

Agreed, but the cost factor also joins in. The Internet is a vastly
cheaper as well as more effective way of moving information. Most hams
view packet radio as only a utility to be used, but not really part of the
"sporting" aspects of ham radio. They feel perfectly comfortable using a DX
cluster to find band openings on HF, but in most contest situations the
"network" aspect of packet radio is actively discouraged, if not even
forbidden. This gives the impression (and I believe, it is mostly fair) that
hams are not really interested in building reliable communications
technology. It isn't considered "sporting".

Since packet isn't part of the sporting part of amateur radio, it doesn't
matter to most hams if they get their data via phone or radio, and the
Internet provides a better bang for their buck.

Ways to combat it? You must be able to convince hams that data networking is
a serious part of amateur radio, and that building radio networks takes skill
every bit as much as Straight Key night. Of course, given the emphasis that
the ARS places on CW operation, it will be a long row to hoe.

Merry Christmas!

Mark

As far as I can tell, Flexnet indeed defines a layer 3 routing protocol
based on AX.25 layer 2 connections, as well as a link quality reporting
mechanism used to dynamically update routing parameters as well as
MAC parameters. In essence, it appears to be net/rom with the addition
of link quality features. There's a protocol there, and an I-frame
PID assigned (0xCE, if I recall correctly, from the AX.25 Version 2.2
specification).

It is worth noting that AX.25 IP runs over both connectionless and
connection-oriented AX.25, the payload portion of both the I and UI
frames looks the same: a PID octect (which doesn't count in the
payload octet count, but really belongs to the payload) and the
data. IP over net/rom works like this, except a net/rom layer 3
header preceeds the IP frame.

>> Have you talked to the FlexNet gruppe?

Thats indeed necessary: literally speak with them.

>If there
>is actually a protocol specification, it would be trivial to publish it
>via the web.

Nope, there is a none.

>> There is a paper available which describes the FlexNet API
>> (Application Programming Interface)

You must distinguish between the API to build ham-radio-application on
top of it (eg. a bbs as BayCom-Box see. www.baycom.org) and the
"Internodeprotocol" running between flexnet-nodes to exchange routing
information and measure the quality of this link.

The latter isn't documented public, although there is an paper from
the 1991 Interradio exhibition in Hannover, Germany which explains the
protocol and some, but not all details (no, it is not availble online
or in english, and i will not translate or publish it).

The only way to write a compatible software is: talk to Gunter (D)K7WJ
(yes, talk, eye2eye). Some people did this and some did not. Meanwhile
there were several Flexnet-like systems which works (XNet) or works
not well enough (TheNetNode, (www.nordlink.org); baycom-node, SNet,
digiware (http://home.pages.de/~dg9ep/digiware.htm). Most of them are
availble in source, so take a look, but update your school german
first: many sources and docs are not in english.

>> In fact, now I remember stories about the XNet system being "FlexNet
>> compatable" but then hearing stories about it's compatibility being
>> incomplete, not fully functional.

AFAIK these times are gone: XNet is obviously full functional

Why do FlexNet does not publish the source code or any specs?
AFAIK the flexnet routing is very vulnerable to bad designed software.
Every node trusts his neighbour, and so you can feed him with wrong
information and get all SABM's for specific or even all nodes. And the

routing in the network and therefore the whole network would be down...
Of course, we do not do this, because we are nice guys and we do not want to get hurt by our fellow hams :-)

But bad software could do this (and - oh boy - i've once written a software with such an error...) and so the Flexnetter maybe think, that only very heavy thinking and talking to them would avoid such accidents.

I can see this point, but IMHO a open spec would have been better. But that is their work, they decide. So go, get the basic ideas (sink-tree-routing, link-measurement) and make your own software / specs.

Gruss,
Walter

Come on. Let's get serious. It's a DOS program!

Forget about it. If you aren't using Linux for your Ham radio
network, you are just wasting your time.

Go down to Best Buy, get a CD of RedHat 5.2, and get on
with your Ham radio hobby. Kick out that Commodore 64,
and that 8088 or 80286 clone machine. Move into the 90's.

You can get a Pentium 75 for less than $300, and with 16 Meg
will even do X windows. 32 Meg will do X and a bunch of
background processes.

Just do it.

Steve

Real time ham to ham communication is, I think, what most ham's enjoy. When I tried packet it was hard to find anyone to chat with. That may be another reason packet isn't more popular...

Gordon, FYI, in developing PK-Term, 9600 packet was tested and seems to work ok between the DSP-232 and a KPC-9612. Also did some minor testing between the DSP-232 and the PK-96. Seemed to work ok.

And 19.2 and 38.4 comm port baud rates worked fine. No problems we encountered.

> so.

This is precisely the kind of thinking which inhibits significant progress in amateur packet software. Perhaps a brief rant about the value of open software systems will be helpful.

Over the past decade, several software projects have arisen with the following characteristics:
a) source code is freely available
b) source code is useable with minimal restrictions
c) improvements to code are actively reintegrated to make the product better
d) anyone is free to make improvements
e) debugging occurs in parallel because MANY users are continuously working on it.
f) makes effective use of donated labor

Projects like Linux, FreeBSD, gcc, Apache http and the like have all benefitted to a greater or lesser extent from this kind of open source mentality. They've all got man-centuries of work involved, and it shows.

When one seeks to change the face of (say) packet radio, one would do well to adopt the successful model of these projects. The creation of proprietary protocols without definitions does not allow people to provide feedback or evaluate them technically. The creation of software without source code does not allow the adaptation of your effort to applications which you have not forseen. Most importantly, it doesn't permit you to leverage the work that other talented individuals may wish to contribute.

Another author within this thread suggested that there is no authentication between FlexNet nodes, hence the network routing is suceptible to either inadvertant or malicious propagation of bad routing information. That would seem to be of concern to anyone trying to create a serious datanetwork, but without a protocol definition to analyze, the degree to which the network is vulnerable cannot be adequately evaluated.

Charles seems to feel that the FlexNet authors work is too important to let it be seen by just anyone. I feel quite the opposite, that their work is far too potentially useful to be kept proprietary. Open software is a potential enabling technology for a renaissance of packet and digital experimentation, but only if people decide that the importance of their work merits its wide dissemination.

Mark

Ah. The only "specification" then is the implementation. Hmph.

Right. I was clear in asking for the protocol specification.

In other words, I've got to schmooze one person in order to gain
access to a completely closed system. No source, no specifications.
No thanks. This is worse than I'd expected, by far. It just isn't
practical for me to travel to Germany or even Minnesota in order to
beg permission to experiment with some one-off proprietary protocol.
At a time when spreading information is easier than ever, this is a
policy clearly intended to prevent the spread of information. If
there was some commercial benefit to be gained, I might understand
this a little, but it just doesn't make sense.

> >> In fact, now I remember stories about the XNet system being "FlexNet

> that only very heavy thinking and talking to them would avoid such
> accidents.

Oh. I get it. Publishing the protocol, or even the source code of the
implementation of the protocol, would invite experimentation. Some of
the experimentation might lead to buggy implementations. So, to prevent
buggy implemetations, experimentation is prevented.

Of course, this is completely ignorant of reality, which is this: if
something becomes popular, people will reverse-engineer it. However,
reverse-engineering is much less precise than working with a specification
or reference implementation, so odds are increased that an independent
implementation will be even buggier at first.

Publishing a specification lays a sound foundation for successful
experimentation; publishing a reference implementation along with
the specification goes a long way towards addressing ambiguities in
the specification.

Charles tried to be clever, suggesting that I might boilerplate the
Flexnet code into some other project, as if this is bad thing. Here's
a wake-up call: boilerplating and/or porting a reference implementation
is one of the most effective ways to prevent incompatible and/or buggy
implementations from spreading. It doesn't necessarily help spread
expertise or foster innovation, which is why I tend to prefer working
from specifications when I can.

> I can see this point, but IMHO a open spec would have been better. But
> that is their work, they decide. So go, get the basic ideas
> (sink-tree-routing, link-measurement) and make your own software /
> specs.

I agree with you about seeing their point (however mistaken I think
they are) and an open specification process would be better.

Thanks for your candid and detailed information!

: > looking for. - Maybe it is!
:
: No, Charles, I was quite specific in my question, I'm looking for the
: protocol specification - without a public specification, there's no
: way to independently build interoperable systems with this protocol.

This brings up an other interesting question, which also applies to
other proprietary systems (such as Pactor II and Clover) used on the
amateur bands. ITU-R Radio Regulations and the amateur radio
regulations in most countries forbids using encryption of data
(although it can be used for authentication in some places). There is
a very diffuse line between a proprietary protocol (especially when
some unspecified packing is used) and encryption.

IMHO, it is against the spirit and possibly also against the letter of
these regulations, unless the protocol _specification_ is publicly
available and at least so complete that any competent engineer could
create his/her own implementation, for at least receiving these
messages.

I have nothing against that the protocol creator keep their
implementation of the protocol (source code, hardware design etc.)
proprietary, since otherwise it might not be economically viable to
market their products. As much as can be said about homebrewing,
building and maintaining network infrastructure, requires in practice
that the equipment should be commercially available.

Based on the available specification, other vendors can then produce
their own implementation and sell them, or any voluntary group could
make a publicly available implementation based on the specification.

Unless we resist the use of proprietary protocols on the amateur band
in which equipment manufactured by X only communicate with other
equipment manufactured by X (think about Icoms only communicating with
Icoms in the more traditional modes), we end up with the situation
prior to 1912, when ships equipped with Marconi equipment were only
allowed to communicate with ships and costal stations equipped with

Marconi equipment.

I doubt seriously that a brief rant will speed up the development of *NOS,
and that's what I was referring to.

Hey! The facts are the facts, and theories are theories.

>

> f) makes effective use of donated labor

Yes, the theory is very nice. The FACT is though, that after ten years of
this "open development" on *NOS, the only significant change was the
addition of a rather poor hack of a full-service packet BBS.

The facts, in other words, do not back up the "open development" theory. -
At least not with the programmers the amateur tcpip community could come up

with. Perhaps another group could do better.

>
>Projects like Linux, FreeBSD, gcc, Apache http and the like have all
>benefitted to a greater or lesser extent from this kind of open source
>mentality. They've all got man-centuries of work involved, and it shows.

Is this why none of these are popular beyond the geekoid community? Do any of these perform significantly better than software written by professionals? - I don't think so.

>
>When one seeks to change the face of (say) packet radio, one would do well
to
>adopt the successful model of these projects.

The most sucessful Packet-Radio related software generally is propriatary. Show me the source code for, let's say, FBB, MSYS, NNABBS, W0RLI, BPQ, WINPACK, PAKET, APLINK, Lan-Link?

I agree that Hams would do well to emulate the most successful models, but disagree that software that any clown can hack up is the "successful model". You would do well to look to the more competent, widely used software, where you will discover that "open development" is conspicuous by it's absence.

>The creation of proprietary
>protocols without definitions does not allow people to provide feedback or
>evaluate them technically.

Exactly. By not leaving the development open to any clown with a book on "C" programming and a pot of coffee, it is possible to come up with stable, superior software. - Like FlexNet, for example.

Hey, FlexNet has not been under development nearly as long as *NOS has, but is still clearly much more sophisticated and capable software than *NOS. Theories are fun, but I go with the facts.

>The creation of software without source code does
>not allow the adaptation of your effort to applications which you have not
>forseen. Most importantly, it doesn't permit you to leverage the work that
>other talented individuals may wish to contribute.

Oh, horse-hockey. All software has source code... Some authors do not want bozos hacking at their software though, and I can't blame them.

Don't forget that your "talented individuals" hacked away at *NOS for over ten years and what little they did manage to accomplish amounted to a third-rate copy of normal Packet BBS functions. - And that was all. Nothing new, no advancement of the art. Just a poor job of trying to emulate the work of more competent programmers.
-- Then the tcpip community solumnly declared the Packet BBS "obsolete", meaning that actually they worked for over ten years to accomplish absolutely nothing.

Perhaps you consider the "open development" of *NOS to be a success story, but I have to go with the facts, and the facts do not support your theory.

>

far
>too potentially useful to be kept proprietary.

Fortunately for us all, the only opinion on that matter that counts is that of the FlexNet gruppe.

It looks to me as if they are the ones who used the system that works best. - And they have the best software to prove it.

Demonstrate ONE piece of open-code Ham Radio software which approaches FlexNet's reliability, sophistication, and functionality with Radio.

>Open software is a potential
>enabling technology for a renaissance of packet and digital
experimentation,
>but only if people decide that the importance of their work merits its wide
>dissemination.

(Yawn) Yes, that's what they said ten years ago when they started the "open development" of *NOS.

We all know what actual results were obtained. - Not much.

There's certainly nothing wrong with open, shared development of software for hobby purposes. (Programming hobby) After all, Hams use CW every day, why not run nostalgia software for digital stuff? There's more to the Ham Radio experience than performance, so if you feel more at home with hobby software or old-style stuff from the 70's, don't let anybody give you a hard time about it.

Example: In my area, the ROSE net guys are all excited about FPAC, even though FPAC is a minor improvent over ROSE at best, and does not represent anything really new or better-performing. Even though FPAC relates to ROSE as Win98 relates to Win95, these guys get a lot of pleasure from their FPAC systems and spend many an hours working out bugs and attempting to make the

software function properly. They could run FlexNet and forget the bugs while significantly advancing the sophistication and function of the network here, but they choose to struggle with the latest in old-style software.

That's what Ham Radio is all about.

Chris, about the least expensive route I know would involve building/buying the standard Hamcomm interface and running Hamcomm 3.1. The interface all new parts from radioshack will set you back $15.00. You could buy one ready built from MFJ for about $30.00. The same interface and software will allow you to run rtty,amtor,cw add the shareware programs jvfax71 or gshpc and you'll also be able to run slowscan,fax (Many modes). Here are some useful addresses.

> of these perform significantly better than software written by
> professionals? - I don't think so.

You're apparently *quite* ignorant of professional software development,
Charles. Apache, for example, is the basis of the IBM HTTP server,
bundled in the Websphere product. Geekoid community? Software
written by professionals? You clearly don't understand how the
free software community works, not even at a high level.

Gcc is widely deployed among professionals, the ease of availability
and portability has made it popular, especially among chip-makers that
need to get development tools deployed for new processors. Perhaps gcc
hasn't been widely popular among the Windows crowd, but even that's
liable to change with the availability of Cygwin and Mingw32.

The depth and breadth of your ignorance on this topic is breathtaking,
and leaves me convinced that you don't actively seek factual knowledge
before engaging in enthusiastic posturing.

The more I read what you write, the more I'm certain you haven't the
first clue about software engineering.

Forbes, August 10, 1998 published an excellent article regarding
the open source community and how it is influencing business. I'd
strongly encourage you to locate this article and read it.

> I agree that Hams would do well to emulate the most successful models, but
> disagree that software that any clown can hack up is the "successful model".

Peer review is one of the most powerful mechanisms to improve the quality
of software. Refusing to publish source prevents peer review; publishing
source invites participation. Companies are moving towards the open
source model for a reason; it promotes innovation and improvement, and
leverages a huge community. Closed-source development can stifle
innovation, and is always *very* expensive. I'm not posturing or
speculating here, Charles, I'm speaking from experience.

Assuming you already have a computer, one cheap way is to build or buy a Hamcomm interface and get a copy of the Hamcomm program.

The Hamcomm interface is a simple circuit made up of a few diodes, resistors, and capacitors. The most expensive parts will be the connectors you use to hook up to your computer and rig. Many people manage to get set up for under $10.

I don't remember where I got the Hamcomm program (probably the BARC pages at the Oakland University site (www.acs.oakland.edu/oak/). Maybe someone else reading the NG will fill in that gap, or you probably can find it with a simple search. Last I saw, Hamcomm was up to version 3.0.

This isn't a great way to go, but it's very cheap. The better the filtering available in your rig, the better it will work.

Other higher-quality, more-expensive programs are available, like RiTTY by Beezely (sp?), but I haven't used them personally. I upgraded to hardware once the Hamcomm experience showed me that RTTY (and Pactor, etc.) is fun stuff.

Enjoy. Good luck.

The hamcomm interface works VERY well if you apply some audio filtering
before the modem. I use a vectronics vec-841 narrowed to 200 hz.

5574. BPQ /Ethernet problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-20 00:00:00 UTC
From: 106255.1565@compuserve.com
Message-ID: <367d243a.3758707@news.compuserve.com>
Source record: 20777

I have BPQ running well now on my pentium with connection to my
network card using the BPQETHER files from W0RLI. I have been having
problems with the dedicated comms machine (a '486)DX/2-66). This
hangs even at the dos prompt when bpq is loaded. It happens even if I
don't load the network card, lsl, odi and other drivers. When bpqcfg
includes the network port entry it becomes unstabele. This is with
EXACTLY the same settins as on the other machine which does work.
Ideas?

Message-ID: <87zp8irb5p.fsf@mongrel.kd6pag.ampr.org>
Source record: 20778

In other words, I've got to schmooze one person in order to gain
access to a completely closed system. No source, no specifications.
No thanks. This is worse than I'd expected, by far. It just isn't
practical for me to travel to Germany or even Minnesota in order to
beg permission to experiment with some one-off proprietary protocol.
At a time when spreading information is easier than ever, this is a
policy clearly intended to prevent the spread of information. If
there was some commercial benefit to be gained, I might understand
this a little, but it just doesn't make sense.

It's actually worse than that. Look at the license agreement:

Licensing Conditions

Note: This is a translation of the german legal terms. It is for
informational purposes only, they have, however, no legal
significance. The German terms are the only applicable terms.

The following legal terms govern the use of PC/FlexNet and its
modules. Different modules from other authors may use different terms,
which should be read in the documentation of the modules!

RMNC/FlexNet, PC/FlexNet and the accompanying utilities and
documentations are a product of Gunter Jost, DK7WJ. Exceptions are
marked. All rights remain at the author. The user has the right to
use the software under the following conditions:

The software may only be used noncommercially for amateur
radio. Every other use, especially in other radio services,
needs in every case the written consent of the author.

...

->> The software must not be patched or changed. Changing parameters
-> however is allowed.

...

So if Flexnet doesn't work with your hardware, or has a serious bug (or goes
out of business), you're out of luck. You're not _allowed_ to fix it! I've
never seen a license agreement like that before! Nevermind being rather
to the some of the basic concepts of amateur radio...

Hi Gang,

Currently run RTTY by WF1B (for contest) and PC-Pakratt (for general use, DOS version) for digital contacts. My packet cluster connection goes to a separate dumb terminal. Setup uses a PK-232 and PK-88 (for packet)

I am planning on moving both digital and packet to a single computer. The question.....

What recommendation can you make for a split screen software package to display the two modes on the computer? PC-Pakratt for Windows is out, I hate it.

Any suggestions?

Thanks in advance. See you in RTTY Roundup, Jan 2.

de Rick, W1TY

Oh. Thanks. Is the paper published anywhere?

> The only way to write a compatible software is: talk to...

Publishing a specification lays a sound foundation for successful
experimentation; publishing a reference implementation along with
the specification goes a long way towards addressing ambiguities in
the specification.
[Dana Myers K6JQ <Dana@Source.Net>]

This raises the question of whether this is permissible under Part 97.
[With apologies to amateurs outside of the 'States.] Transmitting under
a protocol which is not documented might well constitute transmitting
enciphered information, especially where there is a refusal to document
said protocol. We are not allowed to do that in the U.S.:

S 97.113 Prohibited transmissions.

(a) No amateur station shall transmit:

(1) Communications specifically prohibited elsewhere in this Part;

...

(4) Music using a phone emission except as specifically provided
elsewhere in this Section; communications intended to facilitate a
criminal act; messages in codes or ciphers intended to obscure the
meaning thereof, except as otherwise provided herein;

[http://www.mv.com/ipusers/simons/al/radio/part97.html]

(With the sole exception for music being later noted in that section as incidental music in the retransmission of NASA broadcasts, to other amateurs, which are related to the Space Shuttle and with permission from NASA.) [1]

And digital communications are explicitly covered Subpart D:

S 97.309 RTTY and data emission codes.

...

(b) Where authorized by S 97.305(c) and S 97.307(f) of this Part, a station may transmit a RTTY or data emission using an unspecified digital code, except to a station in a country with which the United States does not have an agreement permitting the code to be used. RTTY and data emissions using unspecified digital codes must not be transmitted for the purpose of obscuring the meaning of any communication. When deemed necessary by an EIC to assure compliance with the FCC Rules, a station must:

(1) Cease the transmission using the unspecified digital code;

(2) Restrict transmissions of any digital code to the extent instructed;

(3) Maintain a record, convertible to the original information, of all digital communications transmitted.
[ibid.]

So the crucial issue here is whether a protocol obscures the meaning of communication.

There are exceptions and here are those that i am aware of; where codes, ciphers, and other apparently similar material is permitted:

S 97.207 Space station.

...

(e) A space station may transmit one-way communications.

(f) Space telemetry transmissions may consist of specially coded messages intended to facilitate communications or related to the function of the spacecraft.

S 97.211 Space Telecommand station.

...

(b) A telecommand station may transmit special codes intended to obscure the meaning of telecommand messages to the station in space operation.

...

S 97.215 Telecommand of model craft.

An amateur station transmitting signals to control a model craft may be operated as follows:

...

(b) The control signals are not considered codes or ciphers intended to obscure the meaning of the communication.

...

S 97.217 Telemetry.

Telemetry transmitted by an amateur station on or within 50 km of the Earth's surface is not considered to be codes or ciphers intended to obscure the meaning of communications.
[ibid.]

So if there is a refusal to document a protocol, does that protocol then constitute a mechanism of obscuring communication? The problem with an protocol where there is a refusal to publish [which is not to say that this was the case being discussed by other writers], is that it might contain hidden information, in addition to that which is necessary to facilitate communication. Published protocols are not considered codes or ciphers if their purpose is to facilitate communication: [2]

And i believe Part 97 does require publication:

(a) Where authorized by S 97.305(c) and 97.307(f) of this Part, an amateur station may transmit a RTTY or data emission using the following specified digital codes:

(1) The 5-unit, start-stop, International Telegraph Alphabet No. 2, code defined in International Telegraph and Telephone Consultative Committee Recommendation F.1, Division C (commonly known as Baudot).

(2) The 7-unit code, specified in International Radio Consultative Committee Recommendation CCIR 476-2 (1978), 476-3 (1982), 476-4 (1986) or 625 (1986) (commonly known as AMTOR).

(3) The 7-unit code defined in American National Standards Institute X3.4-1977 or International Alphabet No. 5 defined in International Telegraph and Telephone Consultative Committee Recommendation T.50 or in International Organization for Standardization, International Standard ISO 646 (1983), and extensions as provided for in CCITT Recommendation T.61 (Malaga-Torremolinos, 1984) (commonly known as ASCII).

(4) An amateur station transmitting a RTTY or data emission using a digital code specified in this paragraph may use any technique whose technical characteristics have been documented publicly, such as CLOVER, G-TOR, or PacTOR, for the purpose of facilitating communications.
[ibid.]

But other writers here have asserted that there it is NOT documented publicly.

Now, if the matter in dispute is the transmission of routing metrics, then this could be considered telemetry under S 97.217; which would be permissible. So i suggest that before a 'flame war' ensues about this, we need to find out what protocol is actually being discussed, and what that procotol is used for.

-- KD6PAG

[1] Interesting... Under S 97.113(a)(4), apparently we are not prohibited from transmiting music in the digital form, just not in AM, FM, or SSB.

[2] Again, not to suggest that this is the case being discussed, but if an unpublished protocol in essence obscures communication for the purpose of requiring the use of that software, then I seriously doubt that is legal under Part 97 for other reasons, in addition to the concept that it would restrict rather than facilitate communications.

>Well Charles, since Apache is one (if not the) most popular webservers out
>there, I would say "Yes".

A survey by Netcraft in January 1998 showed that over 50% of all
web servers use Apache. Linux us the most-used operating system
on the internet, with a market share of 26.9% for web servers, 33.7% for
FTP servers, and 25.7% for news servers.

Not to mention the fact that IBM is shipping the Apache HTTP server with the IBM
WebSphere Application Server and is providing commercial, enterprise-level
support for Apache as a partof the WebSphere Application Server package.

Netscape, Corel, Informix, Oracle, Sybase, and other major software
vendors are also supporting Linux and providing their products for
Linux-based systems.

Linux is the number one UNIX operating system used by ISPs.

(source, Linux Jounal, Enterprise Solutions Supplement, January 1999 issue,
just received)

These facts sort of take the wind out of Charles' sails, but I suspect
he will provide another major gust of hot air in his attempts to keep
them filled :-)

Source record: 20788

A question for you SCS owners out there...

I am currently using a KAM'98, and while it performs quite well for a purely analog unit I find myself wondering how much improvement might be available for weak-signal work with one of the DSP-based controllers.

I don't have any real need for Pactor-II, and in fact don't really hear it on the air very much except for the BBS stations. My real interest is how well the DSP aids standard RTTY and Pactor communications. I fully expect that the DSP controllers would be 'better' than the analog units, but there is a significant price difference and I would like to try to quantify the improvement before I purchase. I wouldn't be too thrilled to discover a 'sometimes it's a little better' type of improvement for an extra $700 or so..

So, can anybody provide some comments? Reality-based, please, no hyperbole ("I worked Sudan on 100 milliwatts" or "hell, I didn't even have the radio turned ON and got 100% copy, etc...), just the facts...

Thanks!

- Seth N6BMB

Hello all,

I have an FT-847 that I want to hook up for HF digital modes.
Following the directions in both the 847's and the TNC's manual, I
cannot get it to work properly. I can get the radio to receive and
transmit, but on transmit, it will not send out any data. I have tried
several different ways to wire it, to no avail. (I did get it to work on
VHF Packet though.)
The TNC is a PK-232 BTW. Anyone running this combination that may be
able to help out? I guess I just need to know the proper wiring.

Thanks in advance and Happy Holidays!

Brian

I can't answer all the above, but I think I have a few useful comments.

I run FSK on an Icom 746 using an MFJ 1278B. All the necessary RTTY/Pactor/Packet connections are in the ACC-1 connector on the 746. I get PTT from one of the MFJ's "radio" connectors and feed receive audio to that connector.

FSK comes from pins 3 and 8 on the "TTL" (flat) connector on the MFJ, but be careful. The numbers on the MFJ-supplied connector are backwards from those shown in the manual. So you need to connect a wire to pin 3 on the connector (if you're reading those hard-to-decipher molded-in numbers) for the FSK signal and to pin 8 for ground.

Make a careful cross-check with the manual, the connector on the back of the MFJ, and the loose connector you're wiring the cable to. That may solve your problem.

5589. RTTY/FEC Source Code Wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-21 00:00:00 UTC
From: richard.whitcombe@BTInternet.com
Message-ID: <367d9c00.33546406@news.btinternet.com>
Source record: 20693

Hi,
Im looking for source code for a simple RTTY,FEC or other "simple"
digital mode decoder. Mainly i am trying to see exactly how these
things can be done. I did have a simple FEC decoder listing a while
back but was lost in HDD fail a few months back.
I am particulary interested in the ones using the "Hamcom" type of
simple comparator interface. Any language accepted as im aftr a
general overview (C,Pascal,Basic!!)

TIA

>So if there is a refusal to document a protocol, does that protocol then
>constitute a mechanism of obscuring communication?

"All comm. can contain secret channels"
For example this sentence above. It contains an important information
about me. :-)

The meaning of the FlexNet-stuff, which is transmitted on the air (the
so called internode-QSO) is very obvious and has been "re-engineered"
many times. It contains human-readable information about the
reachable destination (pr-nodes). This is perfect legal, even in
Germany, where the laws converning the contents of QSO are similar
(and sometimes more restricted) to them of the states.

The important, non-documented part is not the 'How to tell the
neighbor node', but the 'What to tell'. Thats the critical and
vulnerable part of the protocol.

Charles is right on the mark with this one! I just spent two weeks rewriting
the NOS BBS so it actually works ... and follows the published BBS
Specification. Mostly the work involved tossing out terribly written
code and starting from scratch. Was amazed to find some of my early
CBBS code still in there, 12 years after I gave it to the NOS folks.
Another couple weeks work and I'll have nntp and smtp working properly.
At this point the rewrite can handle bulletin <-> newsgroup mappings
(and it keeps the BIDs correct) as well as personal <-> email mappings.
All those things were terribly broken in the NOS code. It's about 150k
smaller now too, and runs in a Win98 DOS box without crashing.

Using nntp to test bulletin forwarding, and it works fine.
i.e. BBS -> NOS -> NOS -> BBS.

No internet involved though ... this is all via radio.
So it will be of little interest to the Land Line Lids.

Duane, n7qdn, is working on a "canned" install script.

IF we don't get bored with the project, I'll post the resulting
code sometime early next year. Having a lot of fun using Netscape
and Outlook Express for full interaction with the BBS network,
and forwarding using nntp/smtp as the transport.

This appears to be exactly correct. I looked at Flexnet just long
enough to discover there was no published protocol specification.
Also discovered there were no drivers for any TNCs I owned <smile>
and that there was not even an XKISS driver available. End of story
as far as I'm concerned. Not interested in trying to reverse engineer
"Yet Another Proprietary Protocol" (giggle intended). Were the spec
published, I'd probably do my own device interface, or at least do
the XKISS interface.

> It is worth noting that AX.25 IP runs over both connectionless and

> header preceeds the IP frame.

I've always been curious why nobody is playing with IP directly over
HDLC. Is there some reason not to do this, other than the obvious
effort of making EPROMS with appropriate Layer 1 stuff in them, and

then convincing the FCC it is ok to run it over the air?

Losing a total of 60 bytes in the already short AX.25 frames is a big
minus for tcp/ip over NET/ROM ... but it's all we have here ...

What happened with AX.25 V3? Is that a dead effort? Seemed to have most
of the capabilities claimed for Flexnet, and there is a protocol standard
published, but not yet approved. Have not seen anything about it for
many years.

One last comment: I really fail to see the advantage to Flexnet. What
NET/ROM problems does it overcome? Routing loops? Wide area connectivity?
Does it have zoning (could not figure this out from the specs)?
In the network here, NET/ROM (mostly BPQ running in computers or
in Data Engines) works fine, with the occasional problem usually
tracked down to RF problems not networking problems.

> Ideas?

I've had some reports that sound like memory problems.
Early versions of BPQENET did not allocate memory quite right at load,
and could be trashed by the next driver loaded, if it happened to ALSO
not use memory exactly properly. If you can load any drivers in a different
order, that might cure the problem. The most recent BPQENET has this
corrected (at least I think it is all ok now - no problems reported.)

The other thing to watch out for is use of a single network card with
multiple applications. If you use a packet driver to talk to the card,
things seem to work fine, but NDIS drivers will cause problems.
BPQENET uses frame type 8FF, and you can check to make sure no other
application you load uses that frame type.

Please let me know what you find out. If it is a BPQENET problem, I
would like to make sure it is fixed.

I can speak only to CLOVER, since I'm fairly familiar with that protocol.
There is no encryption involved, just encoding. The protocol was presented
to the FCC and approved for use. It even has it's own data type specification.
There is enough of a protocol specification available publicly that one
could probably create an "eavesdropper" without much difficulty.

But that begs the real question: why should all protocols be public
domain? If you don't like one (e.g. flexnet) don't use it. Use, or
create a different one. I've played with a few different L3/L4 protocols
that run over AX.25. So far none have proved to be any great improvement
over NET/ROM, except for the automated discovery and routing of L2 tunnels.
If I come up with something "interesting" I'll give away the code,
as I did with the original two BBS codes.

> IMHO, it is against the spirit and possibly also against the letter of

Not true at all. The protocol specification, and devices which can
receive the protocol, must be presented to the FCC.

> I have nothing against that the protocol creator keep their

> that the equipment should be commercially available.

What happened to Software 2000?
Why do we have so few new HF protocols?
Why can't I purchase a controller that runs PACTOR-I, PACTOR-II and CLOVER?

> Based on the available specification, other vendors can then produce
> their own implementation and sell them, or any voluntary group could
> make a publicly available implementation based on the specification.

And then the originator of the protocol goes out of business.
There has to be some way for them to recoup development costs.
Licensing the protocol is the only way for them to remain in business.
You don't see Sun giving away Solaris sources ...

Yes, the Apache and Linux projects MAY be counter examples. Until
there are successful long term businesses created, we will not know.

> Unless we resist the use of proprietary protocols on the amateur band

> prior to 1912, when ships equipped with Marconi equipment were only
> allowed to communicate with ships and costal stations equipped with
> Marconi equipment.

Your point is well taken. However there does need to be some means
for a company to make a profit, or they will not develop protocols
useful for ham radio, or will not sell them into that market. We are
very close to a major problem now ... because money cannot be made
in the ham radio market we depend on unsupported freeware, or on those
few companies (e.g. HAL) which are run by hams and thus will market
product to hams with little hope of making money.

Where are the cheap 56k and faster TNCS with integrated radio?
They should sell in the range of $100 ... think about cell phones ...

Thinking about cell phones ... thanks to Nokia for making a large
contribution to my retirement via the very nice increase in their
stock price recently!

You descibed exactly the process I used to get the original packet BBS
code created, distributed and widely used. There were over 20 people
involved in creating the specification, doing the coding, and then
testing and distributing the result. The process worked very well.
One reason that it worked was that there was a single point of contact
and a single decision maker for the resultant product. The same situation
held true for Linux. Once there were more than 3 "main authors" of BBS
codes, things began to fall apart. It seems that some amount of central
decision making is required.

Well ... I did release TWO complete packet BBS sources as public domain:
the original CP/M version, and the CBBS (multi-platform written in C).
That was 5 years work. I do not release source for my current version.
It's just for play and I'm not willing to spend the time and money to
answer questions, help other coders get started ... THREE times ...
There were 5 or 6 additional versions, that I know about, created from
the baseline CBBS sources. Some of those are still in use.

But that is "old stuff". Working on other things now.

This article, and Forbes continued in-depth analysis of the software
industry is certainly the best education available. The company I work
for uses GCC to build all our software products, on multiple platforms.
Why? Because it is the best compiler available for that purpose.
We don't consider it "free", and in fact it isn't. We have a small
group of programmers who's job is to maintain GCC (and all the rest
of the development environment).

You forgot BIND, DNS, news, mail, sockets, Perl, CPAN, and not a few
others. Even Netscape was based on Mosaic, a free browser. Most of the
Internet is based on open source software. Quite an accomplishment if
they are only popular in the "geekoid community".

Open source software when correctly managed has outperformed
commercial software at every turn. It gets fixed quicker when bugs are
found, is more reliable, and has been more thoroughly tested. It
adapts quicker and is quicker to adopt new discoveries from many
different areas of research. GCC has had better code generation and
optimization than any commercial C++ compiler for most of its life.
It's also great to know that the software we are using is the product
of the best minds and experience worldwide, not the product of the
newest batch of wizkids that someone happened to hire for the project.

Does anyone use FAX on the amateur bands any more?

What standards?

What kind of equipment?

What frequencies (HF and VHF)?

Any organizations or newsletters specializing in it?

That is certainly your perception of derivatives of the NOS software. I don't feel it is entirely accurate. Your avowed hatred of all things TCP/IP probably has something to do with it. The original KA9Q net software did most TCP/IP services rather well. I was never too interested in adding BBS functionality to it, because BBSes were already a dying paradigm. I suspect the same is true for many TCP/IP experimenters.

Phil Karn's software _did_ begat numerous versions and revisions. I ran WAMPES on my FreeBSD box for awhile. Not all versions felt distributed their source code or encouraged modifications, and as near as I can tell no one acted as "the keeper of the code" to keep track of bug fixes and produce regular releases. Those are also necessary to making effective open source software.

> The facts, in other words, do not back up the "open development" theory. -
> At least not with the programmers the amateur tcpip community could come up
> with. Perhaps another group could do better.

I've pointed out that Karn's work and derivatives (while imperfect examples) did exhibit some desirable qualities. It hardly surprises me that you didn't acknowledge them.

> >Projects like Linux, FreeBSD, gcc, Apache http and the like have all

>
> Is this why none of these are popular beyond the geekoid community? Do any
> of these perform significantly better than software written by
> professionals? - I don't think so.

Well, you can think so, but these systems are all held very highly by a great many talented software professionals as well as "geekoid" experimenters, and with good reason. The fact that they are not popular with the "computing consumer" community says nothing about their quality or underlying benefits. One might even accurately say the Internet owes a great deal to open source software. The Internet has also allowed the development of open source software. Packet radio has by and large enjoyed no such synergistic boost.

> >When one seeks to change the face of (say) packet radio, one would do well

> Show me the source code for, let's say, FBB, MSYS, NNABBS, W0RLI, BPQ,
> WINPACK, PAKET, APLINK, Lan-Link?

It is at this point highly questionable to say that any packet radio software
is successful. As a matter of fact, all the systems you list I would
classify as "unsuccessful" precisely because of their proprietary nature.

> I agree that Hams would do well to emulate the most successful models, but
> disagree that software that any clown can hack up is the "successful model".
> You would do well to look to the more competent, widely used software, where
> you will discover that "open development" is conspicuous by it's absence.

You are blind. Even Microsoft in it's internal memos is beginning to believe
that open source systems developed by largely volunteer labor can generate
reliable, high quality software (try reading some of their memos as posted on
www.opensource.org). It isn't hard to understand why the type of packet radio
you support is becoming extinct.

> >The creation of proprietary

> >other talented individuals may wish to contribute.
>
> Oh, horse-hockey. All software has source code... Some authors do not want
> bozos hacking at their software though, and I can't blame them.

Fine. But most people (especially most experimenters, as opposed to mindless
drones) won't want to sit back and just suggest changes or bug fixes, and
wait for your talented individuals to fix it. Any software which is a "for
free" project is much less useful, and ultimately much less successful than
open source projects.

> Don't forget that your "talented individuals" hacked away at *NOS for over

> meaning that actually they worked for over ten years to accomplish
> absolutely nothing.

The obsolete nature of packet radio comes largely from the lack of desire to
spend the necessary money and time to develop faster and more reliable links.
The choice of AX25 or TCP/IP actually has very little to do with it.

> Perhaps you consider the "open development" of *NOS to be a success story,
> but I have to go with the facts, and the facts do not support your theory.

It does not suprise me that your view of the facts to not agree with mine.

No, actually, their opinions (and yours, and mine for that matter) hardly
matter at all. It is the group who can manage to convince other hams to use
and improve their systems who counts. Since you seemingly can't get people
to use your system without federal legislation, I am willing to bet against
your view of ham radio.

> It looks to me as if they are the ones who used the system that works

You can't build reliable data networks using retro '70s software. It isn't
up to the task. There is little reason to build a packet network at all if
it isn't reliable, so that means there is little reason to run retro '70s
software.

> Example: In my area, the ROSE net guys are all excited about FPAC, even

Brian,

same rig here, same problems... (but now solved)

You need TWO cables, one for HF RTTY, etc on the "DATA IN/OUT" jack and one for FM operation on the "PKT" jack. Select via "Radio 1 / Radio 2" button on PK232.

See pages 16 & 17 in the manual.

I am looking for help on selecting a data radio that has an integrated TNC and will do APRS. I do not own a 2 meter rig so I dont use voice at all. I am just interested in packet and APRS. I know the new Kenwood HT has the ability but I do not need voice and this unit is very expensive.

Your recommendations would be appreciated.

Thanks

Looking at the age curve of Ham radio (plot age X and number of Hams
Y),
and recognizing the fact that older people do not make large purchases
for their hobbies, imagine having to brief the marketting manager,
that you
want to develop the market. The big boys just can't justify this to
their
stock holders. That's where small shops, one man (woman) outfits have
a chance to make a living wage producing products for.

>Where are the cheap 56k and faster TNCS with integrated radio?
>They should sell in the range of $100 ... think about cell phones ...

I have a simple rule. I divide everything by 10 to check value. When
I was
buying my first new car, it was $1788 for a small truck. That truck
costs
$17,000 now. I would like to spend $1700 but they won't talk :-)

Iceland did this in the 80's (may still do it), but they reprinted
their money
every year, and just took a zero off the end. One day I bought a fish
and
chips lunch for 2400 Kroner, the next I paid 240 Kroner for the same
deal.
I think the US should probably do the same. It makes no sense to
carry
that much money.

So, your example of $100 is really unreasonable, as a $10 solution
seems
impossible. Make that $1000 and that starts sounding about right.

You
can buy a FreeWave 115 kbps integrated radio-TNC for almost that.

There's no way I'm going to sell 56k solutions for $100, unless you
pay
me a monthly subscription fee. Let's say $45 a month for life.
That's
how the cellular boys do it. Hide the real cost. Here you go son, a
whole
radio for $1! Wow. Then the monthly bill comes...

The "damage" (if that's even the proper term) occured because the "global digital network consisting entirely and solely of Amateur Radio links" was less capable than the hybrid network which has evolved.

If you've got a computer (which apparently you do) and it's got a
SoundBlaster sound card in it, you can get on RTTY for just the cost
of a couple very simple cables - free software called Blaster Teletype
(or BTL) is available at

http://www.geocities.com/SiliconValley/Heights/4477/

It's an outstanding way to get on RTTY and it's free - the cable is
simple; one for audio output from your rig to the mic input on the
soundcard; another from the audio output on the soundcard to the mic
input on your rig. Maybe $5 in parts and 20 minutes with a soldering
iron and you're all set.

: And then the originator of the protocol goes out of business.

Only if the "product" is just the protocol. However, if the product consists of some value added features, there is still a healthy market.

: There has to be some way for them to recoup development costs.
: Licensing the protocol is the only way for them to remain in business.

This is true only if the total size of the market is fixed and you are fighting for market shares.

However, if the total size of the market will grow by dropping prices and more features, there will be money to be made for all vendors including the originator of the invention. Take for instance the audio C-casette patented by Philips. They nearly gave away the licenses and the C-casette became the dominant consumer recording format for decades (or have you seen consumer open reel recorders or 8 track cassettes recently). I guess Philips made quite well selling millions of recorders of their own. I doubt they could have been able to sell us much if they had kept the standard proprietary.

There are a few million hams in the world, of which only a few percent have some advanced digital communication equipment. I guess it would be in the interest of all multimode controller vendors to increase the total market penetration to 10 - 30 % of all hams (hundreds of thousands units) by liberally crosslicensing their proprietary protocols to all vendors and still be able to sell a large number of units, instead of jealously watching their market shares on a very small market (tens of thousands units).

IP is a layer 3 protocol. It needs a layer 2 link protocol under it. The
layer 2 protocol does the MAC (media access control) stuff to drive
layer 1 (the physical RF layer). The layer 2 protocol needn't be AX25,
after all IP runs fine over the ethernet MAC layer, but AX25 is what
we have as a radio layer 2 protocol.

>Losing a total of 60 bytes in the already short AX.25 frames is a big
>minus for tcp/ip over NET/ROM ... but it's all we have here ...

Yeah. It isn't bad when you use maxframe segments. That works Ok
for high speed nets such as ours here, but it isn't practical on HF.
But as I'm sure you know, you can run IP over Clover II on HF. That's
pretty good.

Flexnet is a DAMA protocol with masters and slaves. It resolves the
contention problems of a CSMA protocol. Otherwise it isn't much
different than netwrong.

AFAIK the Kenwood HT is the only integrated TNC/radio. But you can easily
make your own "integrated" solution using a PicoPacket TNC, a TEKK radio,
and a rubber band. If you need 2m, then substitute any old 2m HT you pick up
at a hamfest. I bought a Tech America special deal DJ190 for this purpose,
under a hundred bucks during the sale. The little low power Alinco throw away
HTs are an alternative. I've seen them on sale for as low as $69.

Not that I know. The only way I've accomplished that is by using MSYS
or any other software for PC.

>also does anyone have ant good sstv and pactor
>software for this machine

For pactor Lan-Link is fine but for SSTV/Fax there is only MFJ's own
software available. I've started working on a terminal emulator that's
capable of doing sstv/fax and I've gotten it to display the lines as they
arrive but it needs lots of work still.

I couldn't get SSTV to work with any of the common SSTV programs. I got JVFax to work with WEFAX, but the quality was poor -- not enough gray scales.

Most any terminal/modem program will work with Pactor. I routinely use the old Windows 3.1 TERMINAL.EXE program. I've tried others, but prefer this one.

Greetings, all. I've put up a new web site to help VHF packet operators in the Chicago Metropolitan area (including all the suburbs) locate other active packet stations in their areas. The list is new & so there is only one listing there at the time of this writing, but I'm hoping it will become a resource to the VHF packet operators in the area, especially new hams who are trying to locate active stations/frequencies. If you are in the Chicago area and would like to be listed, just fill out an "Add A Station" form.

The ChicagoLand Amateur VHF Packet Radio Station Roster is located at:
http://www.execpc.com/~ih/chi_vapr/

If you are in the Chicago metro area, please help spread the word. If you aren't in the Chicago metro area, consider creating a VAPR Station Roster for your own region or area...I think it could be a valuable resource to us all!

If you enter your station information around the holidays, expect some delays in having the information added to the roster. Once the holidays are over, updates should become fairly fast and regular.

Happy Holidays.

The version of BPQETHER.EXE I have contains files dated around May
1996. There does not seem to be a BPQENET in there! The files I run
are:
DE220pd 0x60 15 0x300
lsl
pdether
ipxodi /a /d
odidrv 98
bpqcode

Apart from the BPQ408a package the BPQETHER.EXE came via N5PVL and
originating from the TAPR site. I used the settings recommended by
N5PVL. I wonder if there is a more recent offering ?

5617. Pacterm '98 and Pk-Term '99 1.2 B Preview updates on the web

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-21 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <uPqDt3TL#GA.237@upnetnews03>
Source record: 20721

An update to the 1.2 Preview version of both PacTerm '98 and Pk-Term '99 is on the web at http://www.cssincorp.com

The 1.2B update provides a word-wrap fix for the H.F. Window and a fix to the {utctime} macro variable , as well as a new word-wrap option for the HF window.

This is another FREE update for the owners of Pacterm '98 and PK-Term '99.

With 25+ years of software development experience in communications, 18 years in Windows development (that's version 1.0, released in 1985), Creative Services Software's mission to to provide high quality ham radio software at a reasonable cost, with no need to 'nickel and dime' the purchaser to death with minor upgrades and fixes.

Pacterm '98 is available from Kantronics. http://www.kantronics.com
PK-Term '99 is available from Timewave. http://www.timewave.com

Both retail for $69.95 which includes free upgrades of all 1.x updates.

I have installed the MultiWin program and am getting errors that state " File not found. CMDialog.vbx" then" Unexpected error; Quitting".

There is no information about this in the manuals. I am not even getting into the program to determine if the TNC works. I have the 1278B, and it was used by someone else on a c-64 system. The unit appears to work fine IE the proper lights go on, etc. One derned heck of a time with this!!!!!! Can someone help me out here??? This is my first experience w/ digital, and not a very good one!!!! Any ideas????

Another great product that was't mentioned below, is the Mim module TNC.
It is about the size of two quarters, unfortunately only transmits APRS
data and 8 other analog inputs.

You can get there through a link at:

http://www.best.com/~wdunckel/ham.html

First of all, this means that the MultiWin program was written in
Visual Basic. A VBX file (Visual Basic Extension) adds capabilities to
VB programs that weren't a part of the original compiler. The
installer should have put CMDialog.vbx on your system.

To find out whether it did, go to MS-DOS Prompt, and type the
following:

CD \ and press Enter
DIR CMDIALOG.VBX /S and press Enter this may take a while

if CMDIALOG.VBX is not found then something went wrong when you
installed MultiWin. If it is found, then the problem is a different
one.

A program, written properly in VB, looks for its VBX files in one of
two directories:

It first looks in the program's default directory. That is, the
directory in which the program was installed. If it cannot find it
there, it then looks in C:\WINDOWS\SYSTEM.

If there's a copy of CMDialog.VBX on your system, try copying it to
C:\WINDOWS\SYSTEM. This will usually fix the problem.

DSP-232 with Roms V1.0b Lot 30 at 9600 packet operation using Winpak
or TPK gives:
- downloading of messages ok
- downloading files ok
- uploading messages extremely poor or impossible.
- uploading files extremely poor or impossible.

Uploading of small files sometimes is successful depending on history
of channel traffic... but very rarely.

I don't particulary like using PC-PakRatt II for Windows. It seems
very slow and I suspect has built in delays to overcome handshaking
problems with the DSP-232.

Gordon,

The reason is that PC-Packratt for Windows polls the TNC, so you have a constant datastream going to the TNC in packet mode...

In PKTerm '99, the only time the polling to the TNC is used is when HF modes are active. In Packet mode, the new program lets the TNC tell it when it has data ready, so there is alot less processor and serial data overhead, than the programs that use the TNC in polling mode. That's because PkTerm '99 (from a programming standpoint) is a state machine, and the TNC's current information set the state of the program.

PK-Term '99 has none of the PC Packratt code in it. It was developed by a totally different company.

The new code does support YAPP file transfers, and after talking to Randy (Timewave) today, we're going to do some extra testing on the 9600 side of the DSP-232 with high speed file transfer. BTW, you can use PkTerm's demo mode with the DSP-232's 9600 baud , since it does support the 2 radio ports in that mode (just packet only, multi stream in each window, with no advanced features). And demo mode is FREE.

Moin,

ke4zv@bellsouth.net (Gary Coffman) schrieb/wrote
>Flexnet is a DAMA protocol with masters and slaves. It resolves the
>contention problems of a CSMA protocol. Otherwise it isn't much
>different than netwrong.

I do not know, what you actually mean with that. FlexNet consist of
several modules:

* an ax.25-implemantation with self configuring parameters and dama -
slave. There are rumors, that parts of this ax.25-implemantation
will make their way into an upcoming Linux-kernel (maybe in 2.3.x)

* a modul for digipeater consist of
* DAMA Master (btw. DAMA is an open protocol)
* digipeating with Hop2hop-ACK
* routing-module, which handles the internode-qso with
neighbour-nodes and maintains a routing table
* AX.25-Header compression, which reduces the flexnet-typical long
AX.25-Header on the Interlinks with 4 and more digipeater in it
(43 bytes IIRC) to 5 bytes

* an API for integrating 'Applications'. E.G. the digipeating module
is such an application. Others are availble, e.g. BayCom-Box, GP85
(Win32 Terminalprogram) and ping-pong-convers.
To be honest, this API only works with PC/Flexnet, and not with the
RMNC-Card (a 6809 based board).

* An API for Level 1 drivers. There are many availble: KISS, 6pack (a
real-time, mulit-device kiss), DSP-boards, soundcards, scc-boards,
baycom-like-serial-port-modems (1k2, 9k6 ...), ip-tunneliug

* an interface to the win32 - TCP/IP - kernel. It's easy to
setup, so you can use your browser and all other services for TCP/IP
over AX.25. It's not fast, but in the Frankfurt area are several
76k8 interlinks and user-qrg's and that's real fast. Some guys are
even make a kind of ATV with that (ok, its more like SSTV :-)).

FlexNet has one advantage. It works like plug'n play. Germany is still
divided in two parts; not ost/west :-) but north/south.
South - Geramny uses Flexnet and North-Germany TheNetNode (NET/ROM).
I'am living at the "border" and a connect to Munich (600 km southeast
of me, 11 hops) works perfectly fast (about 15 seconds) with the
single command "Connect DB0AAB", where a connect to Hamburg (300 km)
north of me) does not work always, and requires some thinking by me,
which nodes to use.

OK, this comparison is not fair, because Northgermany is plain county, without hills to build digipeater on it and they use slow links (mainly 9k6), whereas the south have got many hills, mountains and nodes, and many links are 19k2 and faster.

The biggest disadvantage of flexnet is the not public-availble algorithm of routing.

I do not want to advertise Flexnet (that's Charles mission :->) or start a holy war (such a war is runnung since a decade between NORD><LINk (www.nordlink.org) and the flexnet-people (home.pages.de/~flexnet)), but to put some facts into this thread from a area with many flexnet-nodes and -users .

Gruss,
Walter

>a area with many flexnet-nodes and -users .

the guides providing flexnet and thenetnode haves more communities than
differences.

thenetnode (DOS/TNC3/LinuX) works now with an another routing protocol called
INP (InterNodeProtocol). (please look at this url
http://www.nordlink.org/html/inp3.htm)

Xnet uses the same protocol. the more comfortable site for user is flexnet.
you can easy use this software for an excellent tcp/ip over ax.25 !

so there is no war in digisystem anymore, we have much more the problem with
the bad linksituation.

best regards from germany !

I haven't made any "A - B" comparisons but my gut fealing is that if you have already ruled out the use of Pactor II then the PTC-II would not be worth the added cost. I don't believe the use of DSP alone will yield a $1000 improvement in RTTY. Pactor II on the other hand holds the link better as signals get down into the noise.

That's a gross understatement, Hans. There never was a global packet radio network, just a loose collection of store and forward BBSs. Charles' point (aside from the one at the top of his head) is that the "hybrid" system has negated any need to upgrade that loose collection of BBS stations into an actual packet radio network. To a small extent, that is certainly true, and unfortunate in so far as it has eliminated work on actual radio networks.

But to a much larger extent, that's a moot point since the store and forward BBSs were no longer satisfying the desires of the users anyway. They were leaving the BBSs in droves for direct internet connectivity, just as the users of telephone BBSs were leaving those systems for direct internet connectivity. In other words, it is the BBS paradigm that's obsolete, whether it is over radio or landline. The folks using internet to forward between packet BBSs are also beating a dead horse. They aren't offering anything desirable that a live internet connection doesn't better provide to the user.

If we want to grow robust packet radio networks, we have to offer the user something a pure wired internet can't. Mostly today that's mobile or portable connectivity. And we have to provide that at speeds which are attractive to the user for the sorts of applications the internet and the web have caused him to come to expect, and that means 56 kb or better. That's the direction successfully taken by GRAPES, and it is the direction that TAPR seems to be trying to take with its SS radio project.

For HF, the user has PACTOR, Clover II, and a host of more experimental protocols to give him direct long distance connections. That's fun, and is sometimes useful too. Packet networks are a lost cause on HF. HF links don't have the capacity to serve most of the applications digital networking

users have come to expect, so using it for primary network trunks is a dead issue.

Trunks belong on UHF where they can have enough speed and capacity to be useful. That limits the practical span of our packet networks because we don't have the resources of an AT&T to put relay towers every few miles across the large reaches of the country where there isn't sufficient user density to support and maintain them. But inside our scope, we can do good networks. (GRAPES has 56 kb tentacles into parts of four states now, and that's near the limit of what we can economically do as amateurs.)

In general the viable amateur radio packet solutions today have to be based around concepts where high speed live connectivity is feasible for us to engineer. IMHO this is where we should be concentrating our efforts instead of trying to bring back from the grave a BBS paradigm which has outlived its usefulness. The myth of the global packet radio network needs to be laid to rest. It never actually existed, and unless we come up with some radically different ideas, such a global network probably will never be feasible to build and maintain with amateur resources.

That's true nearly everywhere. The physical layer is the bottleneck. No protocol
is going to fix that. That requires RF engineering, money, and *manpower* to fix.
The latter is the real problem. There are lots of places where we don't have
anyone to support and maintain a needed relay site. There's only so far you
can expect a small group of people to travel in order to install and maintain
network relay sites. That's been a major factor limiting the growth of our network.

Flexnet indeed provides only routing for plain AX.25. It uses a flat
namespace of AX.25 callsigns, and a sink tree algorithm to build a
routing table that defines the route to every destination in the network.
This does not scale very well, as everyone on a large Flexnet network
can see: the destinations list is just a long, long list of callsigns.
It would be much more efficient if it could bundle routes to destinations
that are roughly in the same area and would be routed mostly via the
same path, but this is not possible because AX.25 callsigns do not
provide the information for such route aggregation (as IP addresses do).

It is possible to route IP via a flexnet network, but only by tunneling
the IP packets in an AX.25 connection. The network nodes themselves do
not route IP, only AX.25 callsigns.
This means that each system on the network that wants to route IP needs
to have a large table with IP addresses and associated AX.25 callsigns.
In NOS terms: a fixed routing table and a set of fixed ARP entries for
each IP destination in the table. When an IP packet is to be shipped,
it is put on an AX.25 circuit to the desired AX.25 endpoint. The flexnet
network routes the packet based on only the AX.25 call of the destination,
which should then re-examine it at the IP level.

The Flexnet network does not provide the connecting IP systems with any
information that would be required to build that routing table and ARP
table (like "what IP address is associated with a destination AX.25
callsing" or "what IP subnet can be reached via this destination"), so
all table building has to be done manually by the IP system operator.

It is clear that this will lead to a non-optimal IP network: not every
IP station will setup a routing table to all other known IP nodes in
the network, but rather it will define some "next hop" IP routers,

setup all routes via those, and use the flexnet network as a mechanism
to reach them. This will quickly lead to packets being sent over more
links than required, back-and-forth over the same link, etc.
It also performs poorly for multicasting applications.

What is really needed is an IP-routing network at the level of the
network nodes. A routing protocol with the stability of the flexnet
protocol should be developed, but it should not route AX.25 but IP.
The advantage is that modern network applications and equipment can
directly use the network at the IP level. Compatability with legacy
applications (that want an AX.25 circuit between the endpoints of the
connection) can easily be added: just let the network nodes accept an
AX.25 connection from a user, setup a TCP/IP circuit to the destination
node he specifies, and transport the data there using TCP. The
destination node recognizes this situation (by the TCP port number),
accepts information about the downlink callsign over the circuit, and
sets up an AX.25 downlink accordingly.

In fact, the AX.25 users do not need to be aware that TCP/IP is involved.
And the IP users can use the network at its raw level, just as they
use the Internet. Internet applications, that are available for free
on todays popular platforms, can be run on this network.

It has been my desire to design and implement such a network for many
years. Unfortunately, problems with my health and personal situation
have kept me from doing any real work in the packet radio software area
for a long time. Also, seeing that many AX.25 users don't have the
vision to see the advantage of an IP network, and mostly proclaiming
that Flexnet is the ideal network for amateur radio and everything else
is crap before it is tried, has convinced me that I should not try to
convert them. Maybe someone else has the fresh spirit to dive into
this?

I have done some work in the preparation of such a network, and some of
it is in actual operation in the Dutch packet radio network (although
the use of my software is decreasing because I have not extended it
lately):

- a link quality measurement protocol to determine the usability of a
link between two nodes, independently in each direction

- a node information multicasting protocol, to propagate information about
each node using IP multicasting. this was intended to be the base for
an "AX.25 node table" that the AX.25 users would see, but it also
includes other info that is so notably missing from most amateur network
protocols (where is this node located? who is responsible for it? what
local accesses does it have? what software is it running? etc)

- discussions about a routing protocol, that has lead to a protocol that
can deal with links that work unidirectionally (a student has written a
thesis about the protocol and has done simulation runs)

- I have registered port numbers and a multicast address

It would be nice if this work would be picked up to produce an IP packet network that is really usable and can provide service to AX.25 users as well. Using the Linux system for nodes would be nice, but I expect that a routing-only node would have to be done that runs on small single board systems as well (over here in the Netherlands we use PCs at nodes and running Linux at each node would be no problem, but in other countries single board systems, often even with 8-bit processors, are popular).

I guess I should document the protocols that exist today, so that people can write Linux implementations...

I have had a ptcII for 2 years now. It replaced a Kam Plus.
It does all the modes I use
RTTY, Pactor I/II, Packet SSTV. Fax etc
A real "plus" is the fact that the firmware can be updated free via it's
flash ROM whenever updates, new features are available.
I got cheesed off paying out 20-30 pounds for new eproms for the kantronics.
The only downside at the moment is the lack of gps /arps facilites
thats my 5 quids worth

Actually what I was thinking about was using something like a KPC 3 running off of a 9 volt battery. If you turn off the indicator lights on the front panel, it (the KPC 3) should last quite a while using a 9 volt.

I hadn't thought of aprs, but that seems to be another cool use of PalmPilotPacket.

Has anybody used the PalmPilot for packet and or aprs operations. I haven't had time to hook one up to a TNC and play?

None of my suggestions would fit in my pocket, but they sure would fit nicely in a brief/suitcase or a backpack.

BTW, what is SoftKiss.

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

I keep wondering why we need any network protocol at all.

Packet has been pretty much reduced to keyboard-to-
keyboard, like it was when it was first begun.

Netrom and Rose seem to suffice for remote sites, but Rose
use will drop when TNC-2 clones fade away (like the modem chips
they contained).

APRS is really the only growing part of packet radio, and is
fun because:

a) it's visual
b) you can keyboard through various gateways (HF and Internet).
c) you can send one line emails to internet gateways.

One thing I don't like about APRS, is that it is pretty verbose. If
you connect up to the server in Florida, you can see rather quickly
that compression hasn't ever been heard of there.

APRS suffers from all the bad parts of packet radio. That is, the
digipeater, and hidden terminals.

I forsee the day when high resolution maps can be overlayed with
APRS data, and be updated every 10 seconds.

Using simple math, let's say there are 100 targets out there. That
means we will have 100 ms for a target to update itself. Let's give
it a little breathing room and say 90 ms.

That would be about 13 bytes per target at 1.2 kbps, or
107 bytes at 9.6 kbps or 54 bytes at 4.8 kbps, and finally
about 27 bytes at 2.4 kbps.

Clearly, if we want to update 100 target every 10 seconds, then
1.2, and 2.4 kbps are not acceptable, even with compression.

54 bytes doesn't sound like much, but we wast a lot of bandwidth
with our callsigns in AX.25. We only need to ID every 9 minutes,
so ID'ing every transmission could save some bandwidth.

We would only need 7 bits to identify 128 targets, rather than the
56 bits or so we use now. This brings up interesting problems in
assigning track (target) numbers across the "LAN."

I always hate to recommend the G3RUH modem and 9600 baud,
because it has been such a pig performance wise. The range is
about 1/2 of FSK for the same power. But the number of bytes
(107) seems about right.

I think 56 kbps would be even better, but the cost per node is still
unreasonable.

One area, always mentioned when taling about these things, is
dual rate. That is, the area master can relay target data at the
9600 baud rate, and targets themselves upload on several
channels at 1.2 kbps. Say channel 1 for weather, channel 2 for
GPS ground, channel 3 for GPS air, channel 4 for fixed stations,
etc, etc.

APRS to grow, needs to update every 10 seconds. 10 second
updates with a significant amount of data

Steve

Hi. I'm no expert on RTTY, but maybe you could clarify how you're trying to send RTTY---

1. Are you using FSK or AFSK?
2. Is the PK232 stuck on either MARK or SPACE? Can you toggle the tones?

3. Do you otherwise have full control over the PK232 (can force the receive mode etc.?) or are there other anomalies?

73 and Happy Holidays...

Why not use the FSK mode the 745 has ? Get away from AFSK. The mic
input is always the best, for AFSK, as you have full control with the
mic gain, the packet controller needs to supply very little voltage
out. Using the ACC socket you will have to deal with a high impedance
input. For packet that is no trouble but when you grab the mic for a
voice QSO you will likely receive reports of distorted mic audio.
This is due to the high impedance audio input on ACC socket not
getting rid of the stray RF in the shack. The mic input on the front
is 600 Ohms and the stray RF simply gets grounded here, but the ACC
input is 10,000 ohms and the stray RF gets right into the mic audio
after the mic amplifier. So feeding the ACC socked mod pin, all of
this stray RF is impressed onto the mod line feeding the high
impedance input and then onto the mic audio.

FSK Keying solves all of this and you are not dependent on mic audio
levels to get power out. All the current mark space modes operate
just fine using FSK ie Packet, Amtor, Pactor I, Baudot.
Pactor II and Clover will not operate using the FSK mode.

With FSK keying you get 100 watts out all the time plus the utilization of the CW filters if you have them installed.

Hello there,

Can anyone tell me how to solve the problem I have?
I tried to get back on RTTY recently but I seem to have a problem with transmitting.
All it does is sending out carrier only. Receiving is fine and packet works very well too.
I am using PK-232MBX, FT-1000 and Pakratt II program.
I used to work RTTY with exactly the setup without having any problem before.
I checked all the cables and thier connections and soldering.
Everything appears to be OK.
Any suggestion would be very much appreciated.

Season's Greetings. 73

Subject: Computer control

Hi all.

I wish to computerized the station and need some guidance.

Need to...

1. feed two TNC's (Packet & HF Digital) into a split screen computer display, so I can see both at once.
2. Feed packet spots to RTTY by WF1B software for contesting and send the packet frequencies direct to my Icom IC-765.

Certainly I need 2 or probably 3 comports and a RS-232<->TTL level converter. Should be a schematic for one out there somewhere. Also, split screen software to display the two TNC's.

Any suggestions as to web sources for this kind of info?

Thanks and Happy Holidays.

Just a quick comment on that -- there is a compressed APRS protocol that reduces a basic message to something like 7 or 8 bytes of payload. It's used by the "MIM" and "MicEncoder" PIC devices -- all current APRS programs can decode it, but they don't transmit it (yet).

I believe that someone is building an APRS digi program that will compress normal APRS packets into this format before retransmission.

What I had in mind was some kind of very simple L2 protocol, with minimal
header size. Certainly one needs at least 8 bytes for address information,
plus a few bytes for congestion control and other supervisory information.

Was mulling over the idea of no source routing, no error checking, just
a minimal "This one is mine, it's going here, route it please" capability.

Much like Ethernet, but without the separate MAC address. Implies unique
IP per MAC, but don't see that causing any problems (?)

As far as I remember, the Vancouver protocol had some of these
characteristics.

This would not, of course, interoperate with existing AX.25 systems.
Interoperability would be for the routers to handle, via address mappings.

The reason for mulling in this particular direction was in fact some of
your previous comments on switches vs. routers, along with the observation
that processing cycles and memory are getting very very cheap, and
"traditional TNCs" are not moving forward very rapidly.

> >Losing a total of 60 bytes in the already short AX.25 frames is a big

Data transfer rate of CLOVER or PACTOR-II is "almost" enough,
but too long a latency for what I'm currently working with.
i.e. I'm playing with some things that have similar requirements
on the transport pipe to the stuff that interests you <smile>.

With 7 * 196 bytes or data per keydown it is still a lot slower than
it could be. Darn ... I'm starting to "Sound like Gary" I think.

> different than netwrong.

That's what I thought. I'm kinda looking around for new ideas to play
with. As many have pointed out, the "old BBS paradigm" needs to be
abandoned. My idea is to do exactly that, but to interoperate for a time.

The place to start, I think, is to create a version of NOS that does all
the "BBS stuff needed for transport" correctly, but does not have a
"user mode" or "user interface". Have that pretty much working, and can
use Netscape or Outlook Express or whatever as mail/news clients. smtp
and nntp working fine for transport of AX.25 messages and bulletins between
AX.25 BBS systems. A good deal of work left to do of course, but as proof
of concept it is pretty much working.

The next step, involving http and the "webizing" of things will need
better transport than we have available over radio at this time, at
least in most areas of the country and for sure over long hauls.

Also agree. In fact, I still wonder why S-2000 didn't take this tack.
i.e. continue to release new versions of NET/ROM, to keep ahead of
the hackers, and add a product line of applications based on NET/ROM.

> There are a few million hams in the world, of which only a few percent

Have discussed this with (more than one) of the firms that market
proprietary protocols. Did not agree with the business strategy
I heard from any of them. But I don't know their businesses, and
am not (at this time) willing to bet a bunch of my own money on
a startup to try and prove the concept. That said, I think you are
correct: with crosslicensing plus open standards the whole market
might be 10 times what it is now. A good potential "everyone wins"
situation. Hope the manufacturers read this thread ...

I do not think the facts bear this out. It is us "older folks" who in
fact have the disposable income to make the larger purchases. Kids long
since out of college, retirement nest egg doing fine, and once retired,
the free time to play with the new toys ... results in lots of new toys.

Well, I was talking about $99 cell phones.
Mass market.
Take advantage of existing mass marketted technology.

> There's no way I'm going to sell 56k solutions for $100, unless you
> pay
> me a monthly subscription fee. Let's say $45 a month for life.

I was thinking T1 or better. Remember the learning curve.
That $1000 cell phone soon sells for $100 and then becomes a minor
subsystem in some OTHER system when it hits $10.
Perhaps Ethernet cards would have been a better analogy.
Used to cost me $1000 ($5000 in 1999 $).
Now cost me $9.95 ($9.95 in 1999 $) for a better product.

> That's
> how the cellular boys do it. Hide the real cost. Here you go son, a

Why thank you Dana ...

This project has actually been in the works for about two years,
but my wife's illness and our move to a new house kinda slowed
things down. Now that everything is somewhat under control again,
I'm looking for a few fun projects. Suspect that VHF DXing will
be one of them <grin> and something digital will be another.

Just to help focus on the new stuff, I've shut down my existing
packet BBS system, and will not be doing further work in that
direction. The present test bed is four machines at my home,
plus 4 or 5 machines at Duane's (n7qdn) home. We both have enough
network running to support "houshold level ISP services" and the
test bed is using ham radio to connect the two subnetworks.

It's working great, and is a bit of a giggle. Supports all the usual
internet protocols (http, ftp, telnet, smtp, pop, nntp, etc.).

Right now the gateway code (the NOS based part) runs in a DOS box
in Win95/98 and needs it's own ethernet card. Duane is working on
a "simple" install guide, and I'm debugging the code. Probably something
useful for folks to play with early next year.

The main goal at this time is to support all the "old AX.25 BBS system"
store and forward capability over smtp/nntp. That part is working.

Stay tuned ...

5650. BTL shows rubbish

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-23 00:00:00 UTC
From: Keith Powell <keithp@psilink.co.uk>
Message-ID: <3681361d.0@nnrp1.news.uk.psi.net>
Source record: 20605

Hello and thanks for reading this.

I have just downloaded the BTL Blaster Teletype program and have been having a look at it.

It seems an excellent program except for the fact that the screen gets filled with never ending rows of jumbled up letters, numbers and signs. Apart from looking a mess, this makes it hard to find where a RTTY QSO starts among it all. It decodes the RTTY transmissions OK. Not tried TX with it yet, want to get the RX side sorted first.

Is this a problem with the program or could it be something wrong with my set-up? I have a Pentium and an AWE64 sound card running in Windows98 DOS. It won't work in pure DOS - says it can't find the sound card or driver.

Any advice gratefully received.

Sorry if this has been aired before, but I have only just subscribed to the newsgroup.

Many thanks

Keith

Hi,

Does anyone know, how to receive Subsidiary Communications Multiplex Operation (SCMO) channels with minimal component. It's like FM.

I like to build a receiver which could be operated with low voltage like 1.5 V AA batteries. And I don't want to include an amplifier with it. I just want to build the basic signal decoder and then want to use an existing amplifier to hear the broadcast.

Could some one help me....Please.... if you have any basic diagram or any information would you please send.

Thank you in advance.

Bingo. This is exactly what I've been suggesting to
other packet operators. Maximum leverage of existing software,
maximum leverage of existing development community, and
maximum freedom to concentrate on the added value of packet
radio.

Damn right, Hank!

Keith,

I have used BTL a fair amount. I don't believe you have a problem. When
you tune into a RTTY signal properly (those two bars on either side) you
should get decoded text, otherwise its gobbly gook. Incidentally, I have
found that using the manual capability to adjust the center frequency to
be a very useful feature. Strange as it sounds, I use another soundcard
program called WDECODE to determine the shift. Actually, I use the
simple spectrum analyzer that is built into WDECODE to determine the
shift and then switch back to BTL.

with regard to your problem about not working in DOS, I think you may
have a problem with you soundcard setting in DOS. If you check the BTL
docs, it will tell you what the settings should be. then use the SET
command in DOS to set it. Hope that helps.

That is there way of protection if you contact MFJ that will send you a new disk #1 with your call sign encoded . This will allow the program to be loaded more tham 2 times. The cost is 15.00. Bob KF4ETS

5658. Soundcard software for RTTY tuning indicator ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-24 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <eXI3mJAYMjg2EwS1@dowrmain.demon.co.uk>
Source record: 20612
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Can anyone point me to any soundcard software (to run under Windows 95)
that will display RTTY/HF packet tones?

I don't need to receive or transmit, I just need a simple tuning
indicator.

One of my jokes about NOS, was that now that they got the BBS part working, that they could shut off the TCP/IP part.

Karn and Garbee's code is still in there, but JNOS went off on a tangent. Johan, WG7J and his merry band pretty much wiped out all other derivatives. Dugal, N5KNX is the guy that has presided over the version 1.11 stuff. JNOS never reached version 2.0.

What Dugal and his merry band did, was to fix most of what was there. memory leaks were attacked, etc. But there still remains parts of the distribution that are never used, cannot be used, because they don't work. Lantz's TNOS also made some changes to JNOS, but a lot of his stuff was hacker code. I remember myself and K5JB trying to figure out why one of his new "inventions" didn't work right. Basically we got to the point where all the code was thrown out, and replaced, because the idea while poorly implemented was a good one. Dugal accepted a lot of crappy code, but he did have standards of it must be a good idea, not just another blinking light.

If you strip off all the bullshit in there (all the BBS wanna-be stuff) you basically have a pretty good IP implementation in DOS. Alas, it is hard to find DOS C compilers unless you hang out at Pawn shops and Flea markets. That brings me to my point.

A lot of what NOS does, is now part of DOS (okay, they call it Windows 98 now). That is the underlying IP. What is missing is all the servers you need (SMTP, NNTP, etc). But there are public domain implementations of those. I've spent the last two years using C++ Builder, and you need something like that or Visual Basic to produce code for Windows quickly.

But no. I don't want that stuff on my Windows box. The closest I want to get to Ham radio from my Windows machine, is as a Terminal. I want the Terminal to operate using HTML. If I want to do RTTY, then I'll use one Frame for transmit, and one Frame for receive, and one Frame for Radio control. Like Microsoft said, the new Windows is a Web Browser. Now if they can just educate the Justice Department, we can let the old interface die.

There is one exception to my rule, that has gotten me back to programming on the DOS box. That is the Sun Java. This is "way cool" in the fact that Java is a networking

natural. I can produce a compressed stream connected
by sockets anywhere on the Earth. I can't do that on Linux,
because the level of completion is not there yet (buggy).

I think all Hams who use AX.25 or dabble in it, need to
go get the Sun 1.2 Java (Has Java Foundation Classes)
and then go to Melton's, N6LYT Web page for JStation:

http://www.qsl.net/n6lyt/index.html

This is a great accomplishment, and has the Serial
port Native methods to work with a TNC or a Spread
Spectrum serial port device. The AX.25 is all there,
no sense reinventing the wheel.

Am I missing something here or is the same as I and many others
have been doing for the last 3-4 years (not Outlook Express since that
hasn't been around that long). Certainly that was the idea when the FBB
interface went into JNOS - to import bulletins as nntp and personal
mail as smtp/pop. It *is* good fun and it *is* different/better to the
wired system because I (and many others) get such a kick out of it!!

I'm confused, but very encouraged that the IP side of *NOS is being used
in the States as other than an interface into the wired system, rather
than where is *should* be, to expand the radio side.

The Perl script from dg1kjd to interface convers to IRC and a simple
QuickCam kludge to provide a 'shack-cam' all help to provide more
'interest' for the hobby. I fancy a remote controlled arm as used at
the fair that users can 'log into' and manipulate from afar - not to do
anything useful (apart from try and pick up a teddy bear?) but just to
see if it can be done. Or how about a Circle MUD world written as
a 160m fox-hunt (with angry farmers, jammers, QRM, dipoles to be
found in hidden caves, RF pre-amps to be bought at the junk sale!!)

Lets see more *radio* ideas.

Exactly. That's why I decided to start over, and properly marry
the two parts. Involves tossing out most of the BBS code, keeping
most of Phil's code, and rewriting a bunch of BDale's code.

Most of the WG7J stuff is gone. The patches from Dugal pretty much
remain, since they corrected previous bugs. Some is removed.

I started from several sources: NET, JNOS, WNOS, TNOS.

I'm not doing this in DOS, but in Win95/98/NT, but still using BC4.
Longer term goal is to put the appropriate bits into a Windows
service, where it really belongs. No "user stuff" just "services stuff."

Some other options for writing code that runs on windows,
once the services are in place. I usually don't go as low level
as C++ or VB, since much better tools are available.

Too low level for what I'm working on.

I don't think that's a good idea. Host addresses should be separate from
link addresses. Otherwise, you can't act as a gateway, router, or firewall.
You've got the right idea about the link level protocol being very simple. Its
only purpose should be to establish, maintain, and control a point to point
link between two systems. All routing should be handled at level 3. In other
words, the link level only deals with one link. The kludge of letting AX25
do source routing has muddied this issue too long. We need to make a
clean break from that idea.

The link level needs to be simple, but only as simple as will accomplish
the job. On HF, we need strong FEC if we are to expect good performance.
I suggest use of a punctured trellis coding for that because it reduces the
amount of bits required to the bare minimum for particular channel conditions.
(Note that this implies a stream oriented link protocol, which I think is the only
practical answer on HF. CSMA just doesn't work well on HF.)

>As far as I remember, the Vancouver protocol had some of these
>characteristics.

It had tiny addressing (a single byte, which would only handle a network
of 255 stations), but otherwise it is unsuitable. I think we can stick with
call signs as MAC addresses, but we can compress them so that they
don't take up so much header space. A simple hash would likely work.
We don't need both from and to MAC addresses in the link header. All
we need in the header is the MAC address of the link destination station.
The network level will know which station to use for the reverse path (it
might not be the same path). But we might want to include the from
MAC address anyway for our routing daemon to passively observe
(more on that below).

>This would not, of course, interoperate with existing AX.25 systems.
>Interoperability would be for the routers to handle, via address mappings.
>

>"traditional TNCs" are not moving forward very rapidly.

Exactly. The best router is a Linux box. Most of the work is done already,
and the price is right.

>With 7 * 196 bytes or data per keydown it is still a lot slower than
>it could be. Darn ... I'm starting to "Sound like Gary" I think.

Well, we run longer than 255 byte AX25 frames here. We run up to
4096 byte frames. But we are running on high speed hardware
with very good paths that have low error rates. That's Ok for
UHF, but it simply won't do for HF. On HF the link level needs
a strong FEC, and it needs to be able to respond to a dynamically
changing path structure.

I don't know how you've been using Clover II, but we've treated
it as a bit serial stream and run ppp over it. That's a bit clumsier
than needed, but it is simple to get going. We modified the dialer
scripts to do link establishment. Basically we treat the Clover II
box as if it were a Smartmodem with a funny command set. That
works because the Clover II protocol is quasi-duplex, IE we don't
have to command it to turn around the link. Using PACTOR II
would be more difficult because you'd have to manage link
direction somehow.

We're still dealing with static routing, however. What we need
is a daemon which works off to the side, in a staff position rather
than in line of command, testing and verifying routes and updating
routing tables around the network. Again that's pretty easy at
UHF with stable paths. At HF it is more on the order of the ALE
stuff the military uses. While UHF can usually route based on
geography, HF has to route based on propagation.

There are a number of protocols for identifying minimum cost routes,
but a lot more work needs to be done on this for the amateur environment.

The old mantra about names not being addresses and addresses
not being routes applies here in spades. We want those cleanly
separated. Routes are dynamic, and are established on the fly
in response to realtime conditions. Addresses are administrative
matters which can be handled organizationally. Names should
be resolved and dynamically linked to addresses by nameservers
so that they aren't tied to a particular addressing hierarchy.

Globe Wireless faces the problem of routing according to propagation
and deals with it by using idle shore stations as propagation beacons.
The shipboard systems scan the frequencies and select the shore station
with the best propagation at the moment. Active stations are monitored
passively for the same purpose. That way the shipboard system can build
up and maintain a propagation path map of the network in near realtime.

An alternative strategy would employ propagation prediction software to
select most likely routes based on expected propagation. This removes
the need for idling beacons, but it is a bit less certain. ALE uses a combination
of propagation prediction and path testing to maintain its routing maps.

To sum up what I'm saying here, the radio network is by nature dynamic.
Paths come and go, congestion comes and goes. We need a picture of this
dynamic situation in the routers, handled by a daemon which can alter the
route tables in accordance with the current state of the network. This is done
essentially separate from the link level and network level protocols being
used. It is a daemon acting as staff officer, providing contingency plans to
the command authority in each network box.

Note that this implies that the daemon needs access to the *raw* channel
information. It can't sit behind a TNC or Clover II box. This implies pulling
everything (except perhaps the DSP "dumb" modem) back inside the PC.
The daemon can then be Tee connected off the incoming bit stream at
a point before link management has discarded info from stations other
than the one currently connected.

The P-38 seems a good hardware platform for doing this since the protocol
is already being done on the PC rather than being embedded in hardware on
the card or in an external box. Other DSP, or analog hardware, "dumb" modems
would do too, but might bottleneck on the RS232 link.

Note that I'm not exactly endorsing Clover II as the link protocol. If it were open
and we had source (or at least state machine diagrams), then it might be fine,
but we may want to do something somewhat different anyway. The hardware

would work for us in any case as a modem since we can download the modem
code to it on start up. (We could use a Motorola EVM as the TAPR HF SIG is
doing, but that doesn't give us as tight a binding to the host archetecture.)

>
>Too bad. We badly needs those long frames.

Use them anyway. It is no big trick to make KA9Q and the Linux
AX25 implementations use bigger frames. There's a problem with
a few of the commercial TNCs, but they aren't suitable for network
use anyway. If you want to serve stations using those TNCs, you
can fragment/de-fragment frames at will on that particular link
to conform to their limitations.

I think it is probably time to abandon DOS based NOS. Go to Linux native
support. Source is available (and it is cleaner). There are already Unix
BBSs that use standard sockets which are conforming if you want to
maintain a BBS capability. There's no need to muddy the network waters
by embedding an application in the network code. That's the mistake people
tinkering with NOS have made.

>The next step, involving http and the "webizing" of things will need
>better transport than we have available over radio at this time, at
>least in most areas of the country and for sure over long hauls.

Yes, that's where the work needs to be done. On UHF that problem
is merely one of getting busy and doing it. The hardware to do 56 kb
has been available for over a decade, and the hardware to do 1.2 Mb
has been available for a few years now. This is just a manpower and
money problem (of course those are the hardest kind). On HF, we

are dealing with a much more complex and dynamic medium, and
we're dealing with an archaic regulatory policy which seriously limits
our ability to maximize throughput. There's still a good bit we can
do, but you won't web browse over multiple HF links unless you
have the patience of Job.

You Hero !

Any chance of incorporating the '@hamradio' bid suffix to AX25 bids
so it can be used over this side of the Atlantic ?

Also interested to see how you cope with the little nasties that can
be introduced when someone reads and replies to AX25 BBS bulletins
using an nntp newsreader - like the huge Message-IDs, and the 'WP'
question when multiple nntp-> AX25 BBSs gate the same message.

Source record: 20619

That was a pretty long message, and I won't include the whole
thing; but, the only reason for having a network like the one you're
talking about, is to transport huge quantities of data.

There is really three needs:

1) Routed data hoses for large data streams.
2) Broadcast data sprinklers for small data packets.
3) Broadcast data sprinklers for large data packets.

You earlier talked about receiving pictures while mobile. That
certainly would be a case 3, because all mobiles should not
have to be addressed individually. Although, when I look at the
Atlanta traffic camera's, I notice right away that only a small part
of the picture ever changes. The sign, bridges, grassy knoll, etc
are fixed, but consume more than half of the bandwidth. Personally
I would probably think of ATV rather than some digital scheme...

I don't think Hams have that much data to flow anymore. I flow
95% of my stuff over the Internet, and what data I play with on
radio is pretty low quantity. BUT, I am interested in low quantity
at large rates. That is, an APRS system that does updates in
the 10 to 12 second range.

Sure, most APRS features are static, and hourly updates are
just fine, but I see a need for fast updates. Mobiles with GPS,
traffic radar Avg Speed reports, lightning reports, ACARS,
special events, etc, etc.

A routable protocol, while once important, is less important
these days, because very few Hams do routing, either VHF or
HF.

Creative Services Software is in the middle of development a host mode TNC control program for the Windows CE line. This should be in beta soon.

For now, you can use the windows terminal program included with the Windows CE machines for use with your TNC. Info on how to do that is at http://www.kantronics.com

Has anyone seen/dealt with a problem with missing characters while running packet?
It looks something like this (in the following example I just did an "L" on my PBBS a
bunch of times):

MSG# ST SIZE TO FROM DATE SUBJECT
1 PY 159 KC0ECJ WA0ZQG 12/24/98 05:33:59 D: B,J,K,L,R,S, or Help >
1 PY 159 KC0ECJ WA0ZQ Rob SNW
1 PY 159 KC0ECJ WA0ZQRob SNW
1 PY 159 KC0ECJ WA0ZQob SNW
1 PY 159 KC0ECJ WA0ZQob SNW
1 PY 159 KC0ECJ WA0ZQG 12/24/98 05:33:59 Rob SNW
1 PY 159 KC0ECJ WA0ZQG 12/24/98 05:33:59 Rob SNW
1 PY 159 KC0ECJ WA0ZQG 12/24/98 05:33:59 Rob SNW

As you see, the lines obviously do not align. The message date and time was swallowed
altogether several times. The problem is in the TNC<-> computer link (b/c this is the PBBS
inside the TNC).

Tried different speeds (2400/4800/9600, settings for both the TNC and the Com port in
Windows 98), also tried Hardware and Xon/Xoff flow. WHAT ELSE?

The setup is as follows:

Kantronics KAM+ (8.2)
ADI AT-201, 5 watts
AMD 5x86/133, Windows 98

Any ideas would be highly appreciated.
Thanks
Andre KC0ECJ

Barry,

To the best of my knowledge, there is no 3rd party SSTV or PACTOR program that will work with the 1278B. I know you can use a 3rd party SSTV program with the 1278B by modifying the unit.

I am using the Multicom program with the 1278B and it works fairly well on everything EXCEPT SSTV. The SSTV capability on the unit sucks. I went and tried all types of SSTV programs using the sound card on the PC. The one I liked the best was the new JVCOMM program. I now have JVCOMM and Multicom running at the same time on the PC. Bot work well.

Wasn't thinking about having the host address as the link address,
but having a single address for the port (MAC, serial line, whatever)
instead of an ip address plus a MAC address. Perhaps I'm still not
seeing all the implications.

Agree about making a clean break away from source routing ...

Agree that HF needs stong FEC. CLOVER has some interesting ideas along
these lines, with it's multiple signaling protocols. Perhaps CLOVER
is too complex. From my own experience, CLOVER appears to adapt too
slowly to changing link conditions. I've not played with PACTOR-II,
but would guess that it has a better chance of "knowing what the
ionosphere is up to" due to it's shorter frame length.

Can anyone comment on PACTOR-II's ability to adapt to changing
channel characteristics?

> (more on that below).

My original thought was a mapping table, but a hash would be the same thing
really. Good point on carrying only the one address in the link level
protocol. I need to think about this idea a bit more also. Eavesdropping
has been a major part of the L3/L4 protocols I've been playing with.
The idea is for the routers (and switches too?) to figure out their
routing tables from what they hear. For this to work, it seems to me
that both addresses should be in the frames.

> >This would not, of course, interoperate with existing AX.25 systems.

Here I disagree to some extent. Installing Linux is trivial for those of
us with Unix experience, but it is black magic for most hams. I'd like to
investigate the posibility of Win95/98/NT services as one delivery vehicle,

so that simple install procedures could be created, and the services could
be available to most hams. That said, it would certainly be a lot simpler
to do this in Linux ... since a lot of what we need is already there.

My BBS code expects "a transparant bidirectional stream".

So that's what I've worked with for the past 15 years, at the application
level. Lots of little shims and drivers to make whatever sits below look
a whole lot like BSD sockets, or SYSV streams <smile>.

I treat the clover controller as "just another device" with a unique
command set. i.e. the same way you do.

> We're still dealing with static routing, however. What we need

> geography, HF has to route based on propagation.

Yes. Exactly the idea I was playing with in the "DIGI" code.

"What you hear is what you can route to."
"Tell your neighbors what you know, or let them ask you."

> There are a number of protocols for identifying minimum cost routes,
> but a lot more work needs to be done on this for the amateur environment.

Another interesting area for investigation.

> The old mantra about names not being addresses and addresses

> matters which can be handled organizationally. Names should
> be resolved and dynamically linked to addresses by nameservers
> so that they aren't tied to a particular addressing hierarchy.

It was hard to explain "hierarchical addressing".
Everyone wanted to think it implied routing, when of course it did
not, but rather implied only "hints that might allow you to make
good use of routings you know about when your route outside your
horizon." A lot of things to investigate here, like adaptive zoning.

> Globe Wireless faces the problem of routing according to propagation
> and deals with it by using idle shore stations as propagation beacons.

> up and maintain a propagation path map of the network in near realtime.

Hmmm ... one project I'm toying with is beacon scanning. Since I've shut down
the BBS, I have one HF radio free to use for exeperiments. Thinking about
using it to look for ham beacons, track what is heard when, and thus "know"
which bands are (and have been) open to where at what time. Sound card plus
some software ...

> An alternative strategy would employ propagation prediction software to
> select most likely routes based on expected propagation. This removes
> the need for idling beacons, but it is a bit less certain. ALE uses a
combination
> of propagation prediction and path testing to maintain its routing maps.

The network of HF store and forward systems has always done this,
but manually. Not a very good solution.

> To sum up what I'm saying here, the radio network is by nature dynamic.

For me, this is what provides the challange. "Adaptive networks of
minimally cooperative systems" or something like that.

> Paths come and go, congestion comes and goes. We need a picture of this

That's why I'm thinking about sound cards ... you really do need to see
the raw channel data and play with it.

> The daemon can then be Tee connected off the incoming bit stream at
> a point before link management has discarded info from stations other
> than the one currently connected.

Exactly.

> would do too, but might bottleneck on the RS232 link.

Sound cards avoid the Rs-232 bottleneck ...
The P38/PCI4000 should be good also, but there is the issue of proprietary
firmware involved. Anyone want to create a nice DSP etc. library for those
cards and make it available? One discussion with some of the DSP folks
hints that a PII with MMX has "plenty" of (what should I call it)
"DSP equivalent" cycles available to do anything we need at slow
(< 56k) signalling rates. Probably need dedicated hardware for faster
bit streams though.

I don't think HAL will open the CLOVER protocol, beyond what is already
in their documentation. I've puzzled out most of the state transition
tables, but "most" is not good enough.

My test bed is existing NET/ROM network. Nobody I can connect with
directly right now (a disadvantage of living in the boondocks, and
behind some hills from Portland). Simple to test over wires though.

The only reason to work with the DOS based NOS code is that I have it,
it works, and others can run it. Won't consider Linux because my "target
market" uses Win95/98/NT and will not run Linux. For the stuff I play
with myself, if I was to go Unix, would probably be Solaris 2.6.

The software is coming together fairly quickly. Lots of little details
left to deal with (as several folks have pointed out, the *NOS codes
need some work.)

A bunch of interesting ideas Gary, thank you for posting them.

Don't see why that would be much of a problem <smile>.
There are already several different protocols used by *NOS
to handle BIDs. They all need to be supported in some manner.

> Also interested to see how you cope with the little nasties that can

Well ... that part is actually working. See my last several dozen
postings to LLLIDS@WW and so forth. All posted via nntp using Netscape
or Outlook Express. Of course I "cheated" in a sense by having a
few things still hard coded. Those things need to be configurable.

WP is a different issue. Not sure how that could be dealt with.

From the manual of a 1278B:

Pin 1 - microphone audio, from the MFJ to your transmitter
Pin 2 - ground, audio and PTT common
Pin 3 - push-to-talk, to allow the MFJ to key your transmitter
Pin 4 - receive audio, from your receiver to the MFJ
Pin 5 - squelch input (optional) to allow the MFJ to detect activity
on a shared-mode channel

>That was a pretty long message, and I won't include the whole
>thing; but, the only reason for having a network like the one you're
>talking about, is to transport huge quantities of data.

That's true. If there were only two or three people on packet,
then we wouldn't have much data to transport. It is when
a bunch of people need data transport that large fast pipes
are needed.

It is almost a given that network demand expands to fill available
network capacity. If there is a network. The problem with amateur
radio packet is that there's never been a national packet network,
much less a global one. Most packet networks are less than 4 hops
across, so demand is limited to a local scope.

There is also a threshold capacity parameter at work. If the network
offers an insufficient data pipe size for an application between *two*
stations, then it certainly won't serve a dozen stations, or a hundred
stations. So we get a chicken and egg problem of no good applications
being written because the data pipe is so small, and no incentive to
increase the data pipe size because available applications don't make
heavy demands on it. And I might add, most of the applications which
do exist have little appeal, so we see a drop in packet usage as people
move to the internet where large pipes and interesting applications
abound.

>There is really three needs:
>
>1) Routed data hoses for large data streams.

This describes any network trunk.

>2) Broadcast data sprinklers for small data packets.
>3) Broadcast data sprinklers for large data packets.

A packet broadcast protocol has a place, but IMHO it isn't
a very large place. Most packet activity requires two way
communications. Amateur radio isn't a broadcast service
for the most part. Backhaul requires fat pipes and good
routing.

>You earlier talked about receiving pictures while mobile. That
>certainly would be a case 3, because all mobiles should not
>have to be addressed individually. Although, when I look at the
>Atlanta traffic camera's, I notice right away that only a small part
>of the picture ever changes. The sign, bridges, grassy knoll, etc

>are fixed, but consume more than half of the bandwidth. Personally
>I would probably think of ATV rather than some digital scheme...

No, ATV is out for a number of reasons. Multipath is a key reason.
That trashes ATV, but packet can cope. As you mentioned, much
of the picture information is static, and doesn't need to be sent over
and over. Use of digital compression allows only the deltas from the
fixed images to be transmitted. This reduces the needed bandwidth
to a level supportable by a competent amateur network. Packet also
allows us to relay information, so a large central transmitter isn't
required for each picture. We can distribute the RF load cellular
fashion with a number of relatively low power low site relays. But
we need a fat pipe to interconnect them, and we need routing
between them.

>I don't think Hams have that much data to flow anymore. I flow
>95% of my stuff over the Internet, and what data I play with on
>radio is pretty low quantity. BUT, I am interested in low quantity
>at large rates. That is, an APRS system that does updates in
>the 10 to 12 second range.

Well, think of why you don't use packet for high rate data. Mainly
it is because you *can't* with the existing infrastructure. You aren't
going to try to use 56 kb applications in a 1200 baud network. If it
even worked, the performance would be so low that you'd soon
give up in disgust. Our existing networks are also so small in
scope that they don't give you the reach that you want. There
are a few exceptions, our GRAPES network is one, but most
packet networks in the US are pathetic, barely different from
what we had 15 years ago.

You'll find that you run into the same problem when you try to
have a bunch of stations each send a small amount of data
in a rapid cycle. The *aggregate* demand on the network becomes
just as large, and you can't use pipelining tricks to achieve a
worthwhile level of compression, so performance is even worse
for a bunch of low rate connections than it is for a couple of high
rate connections. The Packetcluster guys have already seen this
problem. More and more of the packetcluster traffic has moved
to the internet in response (because there is no existing competent
amateur radio network alternative to handle it in many areas).

>Sure, most APRS features are static, and hourly updates are
>just fine, but I see a need for fast updates. Mobiles with GPS,
>traffic radar Avg Speed reports, lightning reports, ACARS,
>special events, etc, etc.

Yeah, and when you try to do that you're going to find that the
APRS net topology will kill you. The idea of a single national
APRS frequency is becoming ludicrous, just as the old 145.01
1200 baud packet network idea became ludicrous as usage
increased. The aggregate of all that data needs a big pipe,

and segments of the pipe need to be non-contending to
reduce collisions and holdoff to a tolerable level. That means
you need routing between segments.

>A routable protocol, while once important, is less important
>these days, because very few Hams do routing, either VHF or
>HF.

Yeah, they've abandoned packet for the internet. If we give them
fast fat pipes and connectivity over large areas, we can get them
back. Otherwise, packet is a dead duck for everything except very
minor niche uses by a relative handful of people. Charles is dead
wrong in most of what he says, and attempting to force people to
use inadequate facilities and obsolete paradigms isn't an answer,
but we are seeing people abandon packet radio for the internet,
and the main reason is that the internet has the capacity and
connectivity that our packet networks (such as they are) lack.

The answer to that is to give our packet links the capacity and
connectivity they need to be competitive at the largest scopes that
we can. That won't be worldwide, it won't even be national in the
US, but it can be metrowide or statewide in some cases. If we
have to use the internet to tie those networks together to give
us a national or global scale reach, then so be it, but we should
use our radio facility to its maximum advantage, or we might as
well abandon radio altogether because no one will care. They'll
be on the internet directly where they can get the speed and
connectivity the applications they want to run require.

The emphasis of packet has changed from "gee whiz it is radio",
to "what can I do with it", and to a large extent today's answer is
"not much". That has to change if packet is to regain momentum.
That's going to require fat pipes and good protocols so we can
get good applications running over packet networks.

We were very fortunate here to have a number of hams who
were also network engineers, managers, and marketing types.
They showed us why we had to design our network to have high
capacity and good routing if we wanted it to last beyond the
gee whiz stage and maintain our users' interest and support
over the longer term. It has.

The application mix has changed over time, but the network
infrastructure we built has been able to support it. Our users
haven't been forced to abandon it for the internet. (But that
won't be true much longer if we don't upgrade yet again. The
wired world, and the applications it has spawned, aren't
standing still, and we can't afford to stand still either.)

5682. Re: missing characters - computer <-> TNC ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-26 00:00:00 UTC
From: Andre Konstantinov <konstan@worldnet.att.net>
Message-ID: <7633p5$bfe@bgtnsc03.worldnet.att.net>
Source record: 20636
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.packet,relcom.radio.ham,rec.radio.amateur.misc

I noticed that the problem strictly adheres to the following rule:

It manifests itself in any software package which does not do a
split screen operation, i.e. you type in the same screen you receive stuff.
This includes: HyperTerminal (windows), ProComm (Windows), WinPack
running in "Character" mode.

However, if I run a program with split screen, i.e. when you
have a small separate window where you type, no problem.
Such software includes Hostmaster II+, pacterm (the DOS version),
WinPack (in split-screen mode). Note that WinPack
does not operate in Host mode, therefore it is not the mode problem.
Tried Xoff (with corresp. port settings), flow and all parameters
given by DISP A.

Any ideas?
Andre KC0ECJ

I wouldn't bother with the W0RLI files. Use just the Novell files LSL,
ODI etc. and then load BPQ. I've run this virtually continuously for
around 2 years with no problems.

Here is an extract from my AUTOEXEC.BAT and NET.CFG files (I run Netware
3.2 as well as packet over the Ethernet cable):

AUTOEXEC.BAT (extract)
======================

```
@echo off

cd\nwclient
lh LSL
lh NE2000.COM
lh ipxodi
lh vlm
f:
login
o: (BPQ is loaded from a network drive)
lh ODIDRV 125 (125 specified in BPQCFG.TXT)
cd\bpq\408a
bpqcode
f:
win
```

NET.CFG
=======

```
Link Driver NE2000
INT 12
PORT 340
```

```
FRAME ETHERNET_802.2 (Netware uses this)
FRAME ETHERNET_II (BPQ uses this)
PROTOCOL BPQ 8FF ETHERNET_II ( " "" "" )

NetWare DOS Requester
FIRST NETWORK DRIVE = F

That's a particularly idiotic and baseless statement. There are a few trolls,
but the majority of the posters here are active amateurs.

>But the links we build cannot be used because the traffic which MIGHT
>flow over them is sucked onto the internet instead of being allowed to
>travel over the RF links. Why bother to build something which will not be used?

It certainly won't be used if you don't build it. The reason you should build
it is because you want to build it. That's a sufficient reason for any amateur
radio activity. You might learn something, it might be fun, etc. You don't
absolutely need others outside your networking group to provide test loads
on the network. You can generate the test loads yourself. Bits are bits. The
network doesn't care whether they are "traffic" or the product of random
number generators. But if you build a good fast connected network with low
latency and a low loss rate, it is likely that some others will want to use it too.
We've never had a good amateur radio packet network on anything but a fairly
local scale. It would be interesting to see if you could do something larger than
that. I'm frankly dubious, but give it your best shot.

5685. Icom T8 on packet anyone ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-26 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <O3GzOGAlfTh2Ew6x@dowrmain.demon.co.uk>
Source record: 20639
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

I've been trying to get my Icom IC-T8E working on packet.

Receive works fine, both with terrestrial BBS boxen and with MIR.

Transmit appears to work OK (that is, after I decoded the *very*
misleading schematic for external connections on page 3 of the
Instruction Manual ...!!), but the tones don't sound "right" on a
monitor receiver. The lower audio tone sounds very much lower in
amplitude than the upper tone. I've experimented with drive levels from
zero to well over the top. I have not been able to connect with any
station.

I suspect I may need some audio tailoring between the TNC and the radio.

Ideas/experiences with the T8E (or T8A) anyone?

An IP address *is* a host address, and a pair of them have to be
present to let the next host know who the packet is going to and
who it is from. But it may be that neither of the IP addresses will
be *yours*. IP addresses identify the ultimate source and sink of
IP packets, but don't identify network routers and gateways in
between. The MAC address always identifies *you* to the local
net topology whether you are the ultimate source or sink of the
packet or not.

The MAC address has to be unique on the local topology of the
network. It can be duplicated on a section of the network which
isn't directly reachable by the host, but care has to be taken that
the other segment will always be unreachable.

We can't do that very well on HF thanks to the varying propagation,
so globally unique MAC addresses are preferred. Call signs are
guaranteed unique by government, so they serve as good MAC
addresses. They're a bit larger than we usually need, of course.
We can usually hash them and come up with a shorter MAC address
that has a reasonably high probability of being unique on the currently
directly reachable network topology.

This is moot if we use Clover II or PACTOR II of course since they
need call signs for a connect, but then behave as simple point to
point protocols which don't expect to share the channel with any
other stations. Once connected, we can just run raw IP over them.
(Though we may not want to do that for other reasons.)

>Agree about making a clean break away from source routing ...

Good.

[snip]

>that both addresses should be in the frames.

Yeah, but there are some downsides to passive self-configuration of
course. Especially at HF, propagation changes rapidly, and is sometimes
one way. You'll miss some of your RF neighbors' routes because they
aren't currently active, and you need a way to rapidly purge bad routes
you heard but are no longer functional. That's a problem with most
eavesdropping techniques, good news travels fast, but bad news travels
slowly. You wind up with a bunch of unusable routes in your tables.

You also need to know a bit about who your RF neighbors can reach,
but haven't connected with lately. For example, at a particular time the
best route from Atlanta to Nashville might be via Panama on 10m, at
another time it might be direct on 40m, etc. Unless active links are in
progress, you won't know about this by listening passively. Beacons,
or circuit keep alives, may be required to determine this.

You need snapshots of your RF neighbors' route tables, and their
quality metrics, in order to determine who is your best forwarding
target at the moment. Doing this without eating up all of your network
bandwidth, yet still being reasonably current, is the tricky part.

You really would like a snapshot of the routing tables of hosts more
than one hop away in many cases so you can do a better estimate
of the best total route.

I've thought about using a master router, a route server, which only
receives route table updates from other stations, and responds to
routing queries with a pointer to the best next host in the route. This
would allow calculating least cost routes through the entire network
without the burden of distributing routing information for the entire
net to every host in the network from every other host in the network.

I've shied away from that because it represents a single point of
failure for the network. But it is an attractive idea for a bandwidth
limited case such as a HF network presents.

>> Exactly. The best router is a Linux box. Most of the work is done already,
>> and the price is right.

Well, recent versions of Red Hat have good install scripts. Unless your
hardware is pretty odd, it is almost completely automatic. It seems easier
to me than installing Win95. That fails regularly, and you usually don't
know why. With a Linux install, the reason for a failure is usually obvious.
And of course you can supply an install script for any packet packages
you write, so that installation can be painless too. I think people who
haven't done a workstation install of Red Hat lately might be surprised
at just how painless it all is. And you come up in X with a window manager
that's familiar to most Win95 users, even to having a start button down
in the lower left corner.

But I do realize that there is a larger installed base of Win95 systems,
so your software would have a larger target audience. I'd just like to see
more amateurs move to Linux. The advantages are great, and there is
tons of free software for it that directly relate to amateur radio activities,
almost all of it is in source too, so you can dig into it if you want to
understand how it works, or if you want to modify it. Performance is
better on modest machines too. Linux will always tell you what it is
doing if you ask, with Win95 mysterious things happen and you don't
know why.

Yeah, a network has to do it automatically in realtime. If you had to wait
for operator intervention, latency would go through the roof.

>> To sum up what I'm saying here, the radio network is by nature dynamic.
>

>For me, this is what provides the challange. "Adaptive networks of
>minimally cooperative systems" or something like that.

Well, I think it might be better to consider the systems aggressively
cooperative and gregarious. I think you really want a bunch of glad
handers who light onto every new station they hear like a Hare Krishna
at an airport lights on the greenhorn tourist. They pump the new guy
dry of all the information he has before letting go. Every few minutes
they pretend to have Alzheimers and everyone is a new chum to be
met again.

Well yeah, a PII can *do* that, but you won't have a lot of cycles left over for
it to do anything else. Having a "dumb" DSP to front end the channel for
you frees the host to do other things.

Yeah, but you need to get those nodes upgraded so they can be a
real network. That would be a good first test network.

I can understand your concerns about your target market. I would suggest
that Solaris may not be around too much longer. Linux is really taking over
on Intel, Sparc, and Alpha platforms. (How can you compete with good *and*
free?) And besides, there are all those nice amateur radio drivers already
done for Linux that you can't use with Solaris. I'll be a bit surprised if Linux
ever wins the desktop, but it already owns a large part of the networking
market, and the major application program providers *have* made a major
commitment to bring out Linux versions of their programs concurrently
with the NT releases. That sure begins to even up the playing field. The
Halloween memos seem to show that Microsloth is worried.

Load the articles in comp.dcom.modems, and you'll see ten percent of them
are about CRC errors in Win98. Win98 causes dropped characters. If what I
read in c.d.m is right, no fix is in sight.

One of my machines is a dual pentium, so I tried Solaris 2.7 on it.
I ran Solaris 2.5 on another machine up until early this year, and
liked it a lot. Mainly because it had the WABI software to run
Windows 3.1 Apps, as well as the real Unix that many textbooks
used as a base. Well the 2.7 version did detect the two processors,
but man was it slow compared to NT. Then to make matters
worse, it would lock-up for a minute, randomly, but usually when you
needed something right away. The mouse froze, the keyboard froze,
and there was no type-ahead taking place. Basically the interrupts
were dead until it recovered itself.

It lasted about a month on my system. It still had the "nohup" problem from
Solaris 2.5. That is, if you type "nohup ./program-name &" and then close
the Window, or log-off, the nohup is ignored. I usually had to do a "sh"
first, or a "csh" before a "nohup").

Some of the latest Linux kernels (2.1.1xx) are getting the SMP stuff
(multi-CPU) ready for prime-time. It's quite a roller-coaster ride though.

Ah, so putting Win95 back should fix the problem? That's good news, because
I don't care much for Win98 anyway.

Wait for 2.2. When you run experimental kernels, expect unusual behavior.

Sounds like a bad case of tone twist to me too. The industry standard
pre-emphasis for microphone input is 6 db per octave. So for 1200 baud
Bell 202 packet, the high tone should be 6 db stronger than the low tone.
You would detect this with a service monitor, or from audio taken directly
from a receiver discriminator. This is normal and will be restored by the
de-emphasis network in the audio stages of the receiver of the distant
station. But if you are hearing a difference in tone amplitudes from a
receiver after de-emphasis, IE from the receiver speaker, then there
is excess twist.

There are three causes for this. The first is that your TNC isn't producing
flat tones. Check it to make sure that it is. The second is that your radio
has non-standard pre-emphasis. Check that. The third is that you have
an impedance mismatch between the TNC and radio. That can introduce
twist. When you have identified the cause, then you can attack the
problem correctly at its source.

I suspect the problem will be an impedance mismatch between the
TNC and the radio microphone input. If you are using the resistor
capacitor "leaky PTT" method, you may have made an unfortunate
choice of capacitor and resistor values. Try 1 uF and 10 kohms.

Win98 is indeed known to give problems with COM port overrun errors
causing dropped characters. However, there are a few other things you
can check:-

Does the COM port used with the TNC have a 16550 UART? If it doesn't
then you may find yourself battling against the problem of overrun
errors with both Win98 and Win95. It it has a 16550, is it enabled in
the COM port properties in Device Manager?

Some video cards are notorious for causing comms problems in Windows.
(Matrox Millennium cards are one example, but the latest drivers fix the
problem.) Try reducing the screen resolution and colour depth to the
lowest available, or even temporarily forcing the card to use the
standard VGA drivers. If that helps, then look for updated drivers for
the card.

Finally, a frequent symptom of the Win98 problem is that it tends to get
worse the longer the PC has been booted. So see if the performance of
the PC is better immediately after being booted, and gets worse after it
has been used for a good few hours.

I agree that Amateur Radio Links do not begin to compete with the internet but why do they need to. I think my cable modem is the greatest thing, always connected at light speed "beem me up, Scotty" but I also love amateur radio. It takes some skill to set up a radio station and start rag chewing or bounce off a satellite. The Internet is easy, all you need is a computer, AOL and a phone line, there is no skill involved. I cannot udnerstand why I would want to attach my radio and do the same things I do on the internet. I do not want to do the same things! The Internet is, in a lot of ways, like CB, easy and brain-dead. Ideally, I think Amateur Radio can be enhanced by the Internet and vice-versa. For one to become just like the other would be the death of Amateur Radio only because the next question would be do we need both? Although, I would like to see radios with good 9600 baud performance as a standard feature, so that we could have news groups like this one. What do we need to communicate? How fast is fast enough? How much does it cost compared to the internet(the next best alternative)? Who is going to supply the demand? Unfortunatley, all the creative energies that helped fuel packet, kiss, clover etc are now gone. Where are the experimenters in this hobby and how many are there? Do you think ICOM, YAESU or Kenwood are going to come up with the next great idea? I will guess that they will not. They will supply only what we demand and until we make it a great idea, that they can profit from, will you see it available.

is there a way i can use my sound blaster 16 as a tnc? baud rate ?
how ?
tnx de dave-n2rhl

5701. Kiss eproms and bpq

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-27 00:00:00 UTC
From: 106255.1565@compuserve.com
Message-ID: <368654f6.482842@news.compuserve.com>
Source record: 20655

I am currently using TF2.7 eproms in kiss mode with bpq. I get
occasional situations where these drop out of kiss for no good or
obvious reason which is causing me to rethink my setup I am using
TF2.7 at present for it's dama capabilities.. I have some questions
(not all as simple as they look!):
1. Is TF2.7 really the best chip for the tnc2 in kiss mode?
2. Can TF2.7 be blown with callsign, kiss mode etc flags set as I
used to do with my old 1.1.8 eproms. If so where can I find the
info as it is not on their web page.
3. What are the correct settings for bpq - I havee tnc set to 8 bit no
parity.
4. How can I tell if bpq to tnc speed is optimum or too fast, is there

error count somewhere?
Any help appreciated as this is to be an unattended system and needs
to be stable.
Richard G4BBH

I think this is exactly the way to handle it. From time to time each
system, when idle, should at least broadcast an "I'm still here" message.
That will allow any other systems who have direct connectivity to
do whatever they need to do to keep their routing tables in order.
NET/ROM has some of the right ideas, but as usually set up does not
work very well in rapidly changing conditions. Wasn't there something
like this proposed a long time back, perhaps X.29 and ROSE involved?

Wonder if modifications of NET/ROM might be a useful start point?
There is plenty of code available to play with. Still the issue of
interoperability to deal with.

From previous comment ... just realized it was deleted above ...
my thinking runs along the lines of all hosts being smart routers.
The same address, link and route discovery capability in every box.
The same ability to swap routing information and route capability
and quality information. "Everybody knows everything about everyone,
all the time." I suspect this might have channel loading implications
for slow channels. Some form of intelligent zoning might help.
e.g. subnetting in IP, DECNET zones, etc.

> Halloween memos seem to show that Microsloth is worried.

A whole bunch of "holy os wars" here <smile>. My reading of the situation
is that Microsoft is worried becuase they need to move "upscale" into
Sun and HP server business space. Sun and HP are moving down into Microsoft's
space as well. My Solaris machines never crash. Heck, they hardly ever
even hiccup, even when a disk or SCSI controller dies. Linux can't do
these things yet, at least not very well. IBM, Sun, and HP pretty much
own that market (with a bunch of smaller players as well). My fear for
the Linux business is that it will fragment. Debian, Red Hat, etc. may
become different flavors, as happened with Unix. Linux is not free for
"bet your business" uses. The support MUST be available, whether you
have dedicated staff in house, or contract that staff from 3rd party
suppliers. The machines I work with have 2 hour garanteed maximum down
time (hot spares, manual switchover), and we are looking at faster
respose to failure via clusters, fallback servers, etc. This is pretty
easy to do with the software we use on Solaris (Netscape Enterprise,
Bluestone, Oracle, Allaire, et al). Maybe someday Linux will have all
the stuff we need, but right now it is not an option. Microsoft want's
our business of course, but cannot YET provide the level of service
we require. When they can, we will consider moving to that solution.

But that has nothing to do with the ham radio hardware marketplace <grin>

Probably the best thing we could do with any new software is to create
open standards for protocols and APIs, and publish them widely.
Then anyone can implement on whatever platform they choose.

"Anyone can code to BSD sockets to run IP" might be the motto ...

The problem has indeed been in Windows 98. As my computer is dedicated to packet I don't care what's on it and therefore putting 95 back was not a problem.

If you have a similar problem with your PC<->TNC disappearing characters and you are running 98 chances are putting 95 back on will fix it for good.

Once again, special "ataboy" to Microsoft.

5705. Xmas gift for radio amateurs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-27 00:00:00 UTC

Analyzer2000, one of the world's most fastest and famous audio analyzer,
is now available in the 3.01 version.

As a xmas gift, you have the opportunity to evaluate this software for 14 days
without any limitations.

Just download the actual version from
http://members.aol.com/btf1

After installation enter the license key "140199".

At that point, your shareware copy turns into full functional software.

Features of Analyzer2000 3.01
+++Superfast spectral analysis with FFT display for time and frequency variant
signals
+++FFT sizes from 256 to 16384 points, dynamic range up to 160 dB, graphical
zoom up to 32:1
+++Time analysis with oscilloscope and envelope display
+++Sonagraphic analysis with waterfall display
+++Measurement tools like markers, frequency rulers, level rulers, time rulers
+++Easy determination of THD, SNR (SINAD) and VCO phase noise (dBc/Hz)
+++Built-in test generator for sinewave and/or noise stimulation (full duplex
mode)
+++Multi morse decoder
+++Simultaneous recording directly from PC sound card to standard wave file
+++Snapshot functionality (20 seconds post trigger memory)
+++Analyzing of standard wave files or post trigger memory in offline mode

the problem of ham operators is that hams see themselves superior over
all other people including CBers and scanner listeners. The common
referring of CB is a good example. most people in this world don't
want to join group [hams] like that.

Not being completely familiar with the 1000, I'm going
to assume your sending FSK because my FT990 has
that capability.

You have cabled up the the PK to the 1000 correctly?
As I recall, the FSK output of the PK is on the single
5 pin din plug, NOT the 5 pin straight plugs for radios
1 and 2.

The 1000 transmits when it is supposed to? But only
transmits a constant tone (you are sending some data
right?). Put a VOM on the FSK on the Pk line and tell
the PK to
transmit, watch the needle and see if it wobbles (that's
a technical term). If it does then the problem is with
the 1000.

If the 1000 is like the 990, the shift pin on the RTTY
jack is looking for ground to shift the tone. xmit into
a dummy and ground it, see if the shift changes. If
so you know the 1000 is ok. If not, you have problems
with the FSK shift IC. Just wire it to the PK as AFSK
and forget about it.

Let me know if I can be of any more
assistance.

```
============
APRS via MIR
============
by Ian Wade, G3NRW
28 December 1998

Today I successfully used the MIR Space Station to relay my latitude/
longitude coordinates over a wide area of Europe, using the Automatic
Packet Reporting System (APRS). As far as I know, this is a first in
Europe.

--------------------
System Configuration
--------------------
The picture below shows the system configuration. A standard GPS
receiver on the ground generates a serial ASCII stream containing the
latitude/longitude coordinates of the receiver's location. This ASCII
stream is then fed into a standard TNC and transmitted up to MIR. In
turn, MIR relays the coordinates back to earth. Receiving stations
running APRS software can then display the position of the transmitting
station on a map on the PC screen.

GPS Satellites MIR SPACE STATION

[------] Lat/Lon [------] (~~~~~)
coords
GPS RX 2m TX RX + PC with APRS
Position Display
Software
```

```
-----------------
Equipment Details
-----------------
GPS RX: Garmin 25 LVS with RS-232 serial interface

TNC: Kantronics KPC3+, 8.3 firmware
GPS receiver connected to extra serial port

TX: Icom IC-T8E HT plus power amplifier
Output power: 20 watts to a 1/4-wave groundplane
Frequency 145.985 MHz

APRS Software: WinAPRS 2.2.2beta, with homegrown image maps

---------------
Position String
---------------
Here is an example of a lat/lon position string as received on the
ground via MIR:

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
G3NRW>APRS,R0MIR* [28.12.98 10:27]: <UI>:
$GPGGA,102705,5157.9762,N,00029.3256,W,1,04,2.0,75.7,M,47.6,M,,*62

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

The main fields of interest show the GPS packet timestamped at 10:27:05
UTC, and reports a position of 51 degrees 57.9762 minutes North,
0 degrees 29.3256 minutes West (i.e. G3NRW's home QTH approximately 55km
NNW of London).

----------------
More Information
----------------
To find out more about APRS and WinAPRS software, see:
http://web.usna.navy.mil/~bruninga/

To find out MIR's position at any time in the near future, see:
http://liftoff.msfc.nasa.gov/realtime/JTrack/Spacecraft.html

[Hint: After downloading the images and satellite vectors from this URL,
you can then disconnect from your ISP. A Java applet continues to
display the satellite orbits in real time, running in sync with your
PC's clock. If you then manually wind the clock forward (from the
Windows Control Panel), you can discover when MIR will be overhead your
location].

--------
Tomorrow
--------
If you are in Western Europe, listen out tomorrow (29 December) for my
APRS packets via MIR, on 145.985 MHz FM, at about the following times
(UTC):
```

0552 - 0610
0727 - 0735 (likely to be the best pass)
0902 - 1910
1038 - 1050

Please let me know if you hear any packets from me like the example
above. Better yet, tell me where you saw me on your APRS map!

Never mind, I found the 1995 info at:

http://minnie.cs.adfa.oz.au/Dual/section3_6.html

Basically it is a UI protocol with no FEC... A quote:

"Error recovery is a function of upper-layer protocols, like TCP. "

That's a good plan for a piece of wire, but not radio.

BTL is free in the sence that yes, you can use it and it won't quit on
you after a few minutes, but I sent my $20 dollars in because you could
not buy an RTTY software packge that work as well for that price, and
Brian's work needs to be appreacated in a $20 handshake for alowing new
people to get on RTTY at such a low cost. He will never get his hours
out of it at $20 per user. So support him.

>Does anyone make plans to build a remote control-head for the TS-50?

I run mobile with the TS-50 remoted but without seeing the frequency readout. The rig is under the seat. I simply emulated the programmable microphone buttons on a small control box. (But you could as well just use the mike buttons.) That allows me to tune up and down and zero any station I wish to talk to. I programmed the rig scanner to the band limits which keeps me in the band. In operation I scan until I hear someone I want to talk to, zero him, and then start the contact. Or scan to a clear frequency and call CQ. I don't need to know the frequency because the pre-programmed scanner keeps me in the band. If you need to be on a particular frequency, say for a sked, you could set one of the programmable buttons to switch to a channel programmed to that frequency. You can operate this setup without taking your eyes off the road. (There are many variations you can do with this system that may give you an idea for doing what you want.)

When mobile, Besides the safety of not having to look at the rig when driving, I also like to hide the TS50 for both security and more room. Even though the rig is under the front seat, I leave a few dummy plugs hanging out of the ash tray for when I park. Hopefully the thief will see my antenna, look in the car, and believe the rig is unplugged and removed...

[snip]

Ian,

Apart from the achievement, to which I say well done, may I ask, what's the point?

If you were a mobile station and were likely to get into a situation where you may need assistance form some form of rescue service, i.e. a craft on the high seas, then it could well be a good idea. In fact I believe that GMRDSS is something similar, without the satellite relay.

It's kind of difficult to describe a 1200 bps route as a "pipe", don't you
think?
A "drip", maybe. Or an "ooze".

Otherwise I agree with you.

I can remember having keyboard to keyboard contacts through about 30 digis
from Vancouver to New York in the early '80s. At that time, people were
still dialing up the Internet with 300 baud Teletypes. Now the internet runs
at 30K or better for most users, and most of packet is still using 1200 baud
fm to argue about code.
No wonder there aren't more there!

Hello Les

You might take a look at 14.102.73. It is a very active frequency on 20 meters. Paket on hf is not that hot. I like RTTY on hf much better. If you plan to purchase a TNC, then you might want to look at the Kantronics Kam Plus. I have used the MFJ products before and will never own another. Have a good day.

I am new to HF Packet. Acually I have never been on it but I have purchased a AEA PCB-88 Modem board and I have a "corrupted" PC Packratt88 program diskett supplied with the original computer board.

I need the ability to find either another copy of this program or knowledge of other operating programs, either Dos or Windows based, that I can get and use.

I am open to all suggestions.

I do presently use a Baycom 1 TNC for VHF packet work.

Help !!

Les, K2TGW

You can do this under Linux using the soundmodem driver at speeds up to 9600 bps, with AX.25, Rose, TCP/IP and Net/Rom supported natively by the OS.

For more information, see the AX25-HOWTO at http://metalab.unc.edu/LDP/HOWTO/AX25-HOWTO.html

I'm not sure if there's anything like this for other OS's.

Hi Lee,

PKTerm '99 works with the PCB-88. It's a true Windows 95,98, Windows NT (and Windows 2000) host mode program.

The demo mode allows you to operate Packet with each stream being in a seperate window.

It's at http://www.cssincorp.com/pkterm

I confess to having been somewhat 'taken in' by APRS when seeing it in action in a rather active area (New York and New Jersey) as a 'fun' thing rather than a serious application, but then again, some would apply the 'fun' word to those dreadful nets on 80m where graphic descriptions of debilitating medical ailments and operations are the order of the day. I'd rather go for APRS ....

Sensible??

What is the sense of a 2 meter repeater?
What is the sense of 80 meters?
What is the sense of CW?

Convince me why CW at 20 words per minute is a sensible application,
or that using an analog repeater is more sensible than a digital telephone
or pager working a microsat direct?

APRS is much like the old days of packet, when people sent one liners
to each other, real-time, rather than mail. I remember staring at the
screen waiting for the next comment, or new user.

Now when you stare at the screen there's something other than text
to look at. You can plot direction finding bearings, watch Interstate
truckers cross the US, watch the Shuttle as it zips overhead, etc, etc.

It's not sensible; indeed, I should be out planting a crop to feed the
starving
Russians, or the millions of Koreans, etc, etc. But it's just my hobby...

If you're so sensible, what are you doing on this group?

Walt wrote:

5743. FS - Pasokon SSTV Board

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-12-29 00:00:00 UTC
From: Dick <DickWD8CEB@worldnt.att.net>
Message-ID: <76bo9t$lfe@bgtnsc03.worldnet.att.net>
Source record: 20555

I have lost interest in SSTV and wish to sell my Pasokon SSTV Computer
Interface
Board. If your not familiar with this unit, it is a board which occupies an
ISA slot in your
computer and requires an audio input (Speaker) and an audio output (Mic).
If you
Purchase this board you will receive the Pasokon Board (Version 3) &
Software.
Buyer is responsible for shipping costs.
Cash or Money Order Only.

Hardware Requirements:
1) Minimum 486 or higher cpu
2) Minimum 4 Megs Ram (8 Megs Better)
3) Color VGA Display with video card capable of 800 x 600 resolution and
1 meg
video ram.
4) Mouse. Not required but is very helpfull
5) Disk Space needed 1 1/2 Megs

This is great SSTV system! Makes installation neat and clean.

Cost $125.00 plus Ship

The global digital network of Amateur Radio links is in disarray for the same reason that the global digital network of landline BBS links is in disarray. As my call indicates, I'm new to Amateur Radio, but I helped create the BBS industry and know it inside out (I founded Mustang Software/Wildcat! BBS). The BBS networks including Fido, Relay, etc. were upset not by regulation or lack of it, but by simple migration of its users to better (read more fun) technology. The BBS is dead, and packet, while not dead, is suffering from the arthritis of old technology just the same. For some it ust isn't much fun now that it isn't bleeding edge.

I didn't enjoy watching the BBS get plowed by the net, but I certainly wouldn't have favored legislation to prevent it.

Now lets see if I can get this signature right. How do you guys say it...

If you mean it's easier to put a CB rig on the air, I think CB could
actually be harder than 2 meters because the CB antenna is bigger. All else
is the same: Buy, plug, and play...

>My analogy to CB may not be the
>best but anyone can get a CB radio and an antenna and get started.

I'm not sure much of the above isn't true of ham radio also, at least
certain parts of ham radio. I think the real difference between ham radio
and CB is the test. People who put out a little effort seem to appreciate
the hobby more, and it shows in their on the air operation.

Ian,

Kudos on your effort and the very professional write-up of it.
Don't pay a bit of attention to anyone who dismisses the
accomplishment. You acheived that relay (digipeat) with the gear
typical of the amateur VHF FM station. Nothing esoteric about the
equipment. You applied it in a way most of the folks across the pond
haven't done yet. That's what experimenting is all about!

Major factors that make this method unique (IMHO)

1. TX time 1-2 seconds
2. Gear fits in a fanny pack
3. Uses VHF frequencies available to the majority of amateurs
4. independent of terrestrial infrastructure
5. portable with instant setup.

Brian, I don't! I know what I did wasn't bleeding edge, but it proved (to
me, at least) you can integrate very simple equipment and do things I
wouldn't have dreamed possible even a couple of years ago. By telling the
world about it, I sort of hoped it might encourage others to experiment as
well.

The world is unfortunately full of naysayers, people who say you
can't/shouldn't/mustn't. "No" is the easiest word to say in any language.
If those negative little people are happy in their own negative little
worlds, that's fine by me -- I have no quarrel with them.

Why do it? What's the point? I guess that's the same question which people
ask of mountaineers, hot air balloonists, racing yachtsmen, etc etc.

Season's greetings to one and all.

. . . with one useful exception. 2m packet DX spots have become an integral part of the HF contesting and DXing game. Packet does this much better than the Internet can do it because it's done in very close to real time (seconds) and you do not have to hang on the twisted pair or a cable modem all weekend, you just need a 2m xcvr, a TNC and a few bytes of program code.

I was refering to the technical ability required to start, not the content. I would agree that there are volumes of excellent content on the Web, as well as, volumes of trash. My analogy to CB may not be the best but anyone can get a CB radio and an antenna and get started. Becuase it is so simple and not policed people take advantage of it and bring it down to its most crude level. The major differnece between the internet and CB is that the internet does not get brought down to that most crude level(unless you want it to). CB is more like a 40 channel chat room.

I have programmed a top and bottom range within 10 meters in memory ch. 99
it says prgm or something, and I agree it's very useful for keeping my eyes
on the road. Is that what you did? Good idea on the dummy plugs, they've
been using chainsaws on dashboards around here lately. There's not nearly
enough dis-incentive, uh-oh I'm starting to get off subject. How would I set
a PF for a channel, I practice alot of code at 28.150, but when driving
ussually stick to the phone band. The manual is awful about codes for the PF
keys. Tnx-n-advance, Jim

Thanks for the info. Good plan with the not looking at the display while
driving, but I hadn't figured out how to set limits on the vfo's except when
in memory channel 99, and set-up so memory channels can be tuned. I read the
manual but it's not red-hot on this or the codes for the PF's. My wants in a
control head doesn't need a display, but a tuning knob would be nice. Could
you drop me an email if you are willing to discuss this some more, I assume
no-mail.net would get bounced back.

So basically you are saying that everyone involved in CB are lowlifes. Well, I have some news for you since you have a short sighted view of things. Just like amateur radio, CB radio has its good guys and its bad guys. Don't tell me that everyone in Amateur Radio is good and all in CB is bad. There is good and bad people in every hobby, group, occupation, and in general life. Of course, what you are really doing is to paint all people in CB with a wide brush. Hitler, Stalin, Mao, and numerous others have done that and painted people they did not approve of with a wide brush. I bet that you haven't paid much attention to some of the trash on the ham bands. Go down to 3.853, 3894.5, 3901, 3922, 3950, 14.300, 14.313, 7258, and other frequencies and monitor for a while and there will definitely be scoffaws and troublemakers on the air. Most of them are amateur operators with their FCC approved callsign and they play music, use foul language, play jammer tapes, and other activities. Yes, I'll admit that there are some losers and boozers involved in CB. But there are also a large majority of people who happen to be good family people who obey the rules within reason and enjoy the hobby much like many enjoy amateur radio. Many of them go to work and support their families, they run clean stations. Also many a CBer happen to be rather technically proficient unlike your classifying all CBers as morons. Some CBers happen to be knowledgeable about antennas, radio, and even unfortunately amplifiers and other material. How many hams are proficient enough at their craft. Yes, some are but many couldn't even solder a PL 259 onto their coax and build a decent antenna. SO WHY DO MANY AMATEURS END UP BUYING ALL KINDS OF COMMERICAL PRODUCED GARBAGE OTHER THAN TRANSCEIVERS. Hmm, that could be up for debate. As far as all CB being crude, that is far from the truth. Yes, there are some characters on CB who have some problems and cause problems. Yes, many CBers buy commercially as well. As far as bad language on CB, there is quite a bit, but tune around and monitor the ham bands and you will find a good share of it and other unnecessary commentary bordering on the crude and tasteless and crossing the medium. A good place to listen to good CB is on sideband throughout the licensed channels and on the unlicensed frequencies.

The Internet model of direct communications between two end devices within
a subnet (a multiple access network such as a single Ethernet) and routing
between subnets may be of use. Or, I may merely be objecting to your term
"a point-to-point link between two systems", (rather than, perhaps,
"communications between two hosts within a subnet comprised of many host").

>It had tiny addressing (a single byte, which would only handle a network

>MAC address anyway for our routing daemon to passively observe
>(more on that below).
> [...]

A common form of address compression (well, sort of) is to substitute a
virtual circuit identifier for a end station address. Less obliquely,
datagram networks such as IP need to include the complete addresses of
end systems in every packet. Connection-oriented protocols, such as X.25
(the real one) or ATM establish an end-to-end connection and then need only
to "address" the connection, namely with a virtual circuit identifier.
As a result, the size of the address for a connection-oriented protocol
needs to be only large enough to identify all the active connections
[visible at one point], while a datagram protocol must have addresses
large enough to identify every possible host. (Of course, something
has to maintain the dynamic mapping between a VCI and a connection and
the end stations.)

I would be a bit leery about not including the origination address
in a MAC-level frame. It is often useful to return information to the
originator without understanding the higher-level protocol and its
addressing and address assignments. See, for example, ICMP packets.

On the other hand, never mind, I still don't have a rig on the air...

MARY!!!!! (and Scott, too!!!!!)

How great it was to pull up my e-mail and see your terrific X-Mas poem. How did you get our e-mail? Who ever did it, thank them for me. You truly have been on my mind since the reunion and Christine's Mom's death. I sincerely hope I didn't insult you and Scott at the reunion. As I said when I called, I never did behave very well in big crowds.

Christmas was great here. Shannon got her room redecorated (we've only been here over 8 years!) and the lava lamp was the big hit to top off the dedication of the room. Wish I had saved mine from 1971. We try to put a little Christianity into our Christmas holidays, so since Shannon's birth 12-22-84 we told the kids they would receive three gifts from Santa just like Jesus got. It's worked pretty well until this year. Sean is almost 13 and came to me and told me his three requests - one pool table, one ping-pong table and a foosball table. I told him to get a job! Now that Santa is out in the open, we can tell them that Santa has a BUDGET!

I was sorry that I missed you at the visitation for Helen Weldon. I knew I couldn't get away for two days so I opted to go the day of the funeral. I think Christine was glad to see you and Martha there the night before and glad to have a friend the day of the funeral. My Mom went with me to the service and I helped set up the food and drink at St. Leo's. Boy was that a rude awakening. The school is now closed and the walls really seemed to close in on you. I had to remember that the hallways hadn't gotten smaller . . . I had gotten bigger.

Well I'm going on as usual but I was so glad to get your X-Mas letter. I hope you are all settled in your new home and had a great holiday. I was home the weekend before Christmas to see my Mom and Dad. They are both retired and doing great. I really thought that when they retired, they might kill each other. Not yet but keep your eye on the Columbus news.

We would really like to have you and your family visit Cincinnati sometime soon. With kids so little, I know it's hard to get away but I think it would be great to get together and really catch up. If not the families, then I would do my best to get you, Martha and Christine here for a girls' weekend. I know I'm the one farthest away, but it would be a few days away for you all with small kids. Mine are at the stage that they are driving to the projects with Bob Ramsey drinking Little Kings. I just wait for the cop car to pull up in my driveway.

I truly hope to hear back from you soon. My catering business is doing great and I'm having fun with it. Mark's practice is good also --- crime all the time!

Have a wonderful New Year's and best to you all.

Maureen

For what it is worth, only the destination IP address is required to get an IP packet from host A to host B, (ignoring some largely experimental stuff or the configuration of some packet filters, etc). The origination address is used only:

o by the destination host to send a reply back to the origination host,

o by intermediate systems to return certain types of control messages back to the origniation host (e.g., a "Hop Count Exceeded" ICMP message), and

o for maybe another thing or two I forgot about (but probably not).

Well, nobody has owned up to actually using FAX on the amateur bands.
Seems like radio FAX has gone the way of Hellschreiber and other
antedeluvian systems, replaced by SSTV as the low-speed image mode of
choice.

Thanks to everyone who emailed me.

Happy New Year!

Greetings

Having seen the much improved content in this newsgroup over the
last couple of weeks I feel more inclined to ask some technical questions...

I (like many others I'm sure) am fed up with 9k6 packet links using
RUH style modems getting trashed by simple noise pulses or simply
not being very good when the RF level is low.

To this end, I'd like to design a module that sits between a 9k6 modem
that has been 'tweaked' up to 14k4 and a TNC/SCC running 9k6. This
module will introduce 4 bits of FEC coding for every 8 bits of data. It
needs to be self syncronising and independant of the packet (block)
size so as far as I can see, I require a Viterbi convolutional code.

Trouble is, I can't find any chips that do it with less than 84 legs
and they all insist on handling multi-megabit data rates and include
all sorts of extras for digital TV!!!

Can anyone help, both in a more accurate description of what I require
(I think I'm talking about a 1/2 code with 4 check bits to 8 data bits?) and
what hardware is available to implement it (bearing in mind the low
data rate and low functionality required).

Enter Phil Karn and Qualcomm ASICs (he says hopefully) to solve this
problem!

Happy New Year

>Good plan with the not looking at the display while
>driving, but I hadn't figured out how to set limits on the vfo's

There is no way to set limits on the VFO's. I set the limits on the scanner for the area of the band I want. The scanner then will scan only within those limits and you won't go out of band. Program one of the mike buttons to start the scanner. It scans across the band. When you hear a signal hit the same button (or PTT) and it will stop there. Use the up-down mike buttons to fine tune it and your there. Also you can leave the squelch full open to keep the scanner from stopping on garbage. In this case the scanner will update only every 6 seconds or so, but you can use the up-down mike buttons to prod the scanner in this mode. I programmed my scanner to jump 1khz so I just push the up-down mike buttons jumping 1khz until I find a signal, then turn off the scanner and use the same up-down buttons to fine tune. That's not how it was designed to work, bit it does...

I'm don't even understand how FAX would be any different than SSTV. Except
for maybe being a little higher in resolution or soemthing.

It isn't really, except that FAX traditionally used electromechanical
machinery to scan original documents and print them, as opposed to
entirely electronic means.

In practical terms, this is basically correct. Actually I *do* play
about with fax modes occasionally, both colour and monochrome, on the 2m
band. However, I certainly don't use rotating drums!

I've used fax from time to time. If you have a document to send that requires that it can be read then by all means fax is the way to go. SSTV is far lower in res than the fax modes. We used to run a Sunday SSTV net here in Southern Ohio on 145.560 mHz. There were times we wanted to send Circuit diagrams or instructions for this project or that. SSTV cant supply enough vertical lines to be useful. Start your own fax net, find a few friends and run it....73

The problem with your idea, is that the output of a 9600 baud RUH
modem is not bits, but a modulation waveform. You couldn't mix
that with bits, and get anything useful.

Karn also mentioned the "Interleaver" algorithm. That is some method
of preventing burst errors. I'm picturing a block of 256 bytes of data,
that is chopped into 16 byte segments. Take the first segment and
stand it vertically. Take the next, and stand it vertically to the right of
the first. When you get done, you have a 16 x 16 byte array. Then
you run this into the convolutional coder by taking the data from the
array in a horizontal order. Thus, a burst of noise will knock out
only 1 or 2 bits of a vertical block rather than all of the bits.

Basically you want to modify the modem at the input. In your case, a
4k8 data source with a 4k8 coder to give you 9k6. That is a rate 1/2
would mean the data is 1/2 the final rate, thus 8 bits of data gets
8bits of FEC.

Using a modern CPU, you don't need any chips at all. Karn did over
200 kbps on a Pentium class machine, and you're only asking for
1/20th of that. You can do the whole thing with a Pentium 75 and a
sound card :-)

I've been looking at the MDT program, which decodes
the police packet radios they have in their cars. It's interesting in
that it uses the Windows multimedia sound interface. I didn't know
how to program to that, and it looks pretty straight forward. The
MDT program converts a 4k8 data stream from the discriminator
output, to viewable data. It uses some low level C code that is
interfaced to Visual Basic (for the GUI). The programmer there
used a 44 kHz sampling rate on the sound card.

Just about any HPC will do the job on packet whether it's running CE 1.0, CE 2.0 or even the Palm Pilot series. The limitation is there is no current packet dedicated program for any of the operating systems for the HPC's. But, connecting your KAM to a HPC is no problem and you can run packet using the Terminal program supplied with the HPC operating system. The key hardware problem is you must use a null modem adapter to connect the HPC to the TNC since a HPC's serial port is made to talk to another computer (DTE) and the TNC is a communcations device (DCE). In the terminal program, the setup is fairly simple. Set up comport, when it asks for a phone number, any random set of numbers or letters will do. This just invokes the handshake between the HPC and TNC. once you see the TNC's log on message you're 99% there. Type in "echo on" and you are set. Without echo beon, you can't see what you are sending/typing. Just follow your KAM instruction book for the various commands after that. I run a factory refurbished Casio A-10 that I upgraded to an A-11, all for under $200, a Paccomm Pico-Packet TNC and various HT's and mobile rigs. Works nice.

Good luck & 73's

The idea is to put this FEC device *between* the SCC/TNC and
the modem - ie. on the digital side, not the analogue side.
Thought I'd made that clear...

But on a remote site I don't want a namby-pamby PC that stops if
the temperature drops below 10C or goes above 40C - I want a solid
state, rugged TNC or similar with no moving parts (disk) and I want to
make use of existing firmware (X1J etc) to drive it (due to the current
investment in that firmware/hardware) - the modem is the easy bit
having just helped to design one that will *retail* at less than $50US.

Why focus on an ASIC? At the data rates you're interested in, a pretty low-end GP processor could do the trick, I think. Maybe even a microcontroller chip. That approach would also allow you to do interleaving to combat burst errors.

> Enter Phil Karn and Qualcomm ASICs (he says hopefully) to solve this
> problem!

Right mentor, but wrong technology. :-) Phil has some sample software convolutional coders/decoders that if ported to simple hardware might do just what you're looking for. See:
http://people.qualcomm.com/karn/dsp.html#4

You might also at least think about actually replacing the 'RUH modem altogether, using a little DSP to perform its functions. It's not that complex a process. And that way you could implement sequential decoding with soft decisions, gaining a several dB advantage over doing all of the processing on the digital side. Worth considering, anyway.

I agree that what I said may sound a little short sighted when it comes to CB. Most people who have CB's are decent people, I own and use one on vacations. I think CB is an excellent way to get started in radio but it is not family radio. My point was only this, that becuase it easy and un-policed it has some bad elements, as in any other facet of life. My point regarding the internet is somewhat like CB was this: it takes no discipline to obtain it therefore there is little respect for it! When I first started on the internet I had to load a protocol manager and configure for each network I was attached to. I had to understand TCP/IP and NETBEUI to get connected. I had to then figure out how to load the winsock after the Win32 module. Now I can only ping what I wanted to get to! Then I had the load the application layer. Any how, It was not as easy as plug & play & pay! This issue is very analagous to the morse code requirement to get licensed. To get my license I had to learn morse code therefore I have a greater respect for it. Not because of the code itself but because I had to obtain a skill before I could get the license. Drivers license and hunting licenses work the same way. My post was not about CB but about digital communications in amateur radio.

Hi,

I'd like to build a wireless link between 2 houses that are about 3 miles apart with a link that is at least better than ISDN speeds, preferably with speeds of > 1 Mbps. I've seen the plan by N6GN at http://www.tapr.org/~n6gn/hr89/uwvarticle.html but I'm not sure if this can actually be built. There's not really any schematics - has anyone used this paper to build a working transceiver? Does anyone have any more info for this project? I've also seen the page http://www.shfmicro.com/gunn.htm that has a lot of microwave parts which say they can be used for a wireless data link but I'm not exactly sure how to go about using them. I'm sort of a beginner, how

easy would this project be? Does anyone have detailed plans / hints? Thanks for any help.

Nick

Ok, let me try to clear this up. Suppose we have a simple network
with four hosts, A, B, C, and D in the following topology:

A-1-B-2-C-3-D

Where A, B, C, and D are the stations and 1, 2, and 3 are the
discrete link level connections between the stations.

Now each has an IP address, and each has MAC addresses
(1 each for A and D, and 2 each for B and C). When A has a
packet for D, the packet must be relayed by B and C. So what
addresses must be used for link 2?

It can't be the IP address of D, and it can't be the IP address of A.
They're not directly reachable. It must be a pair of addresses
unique to the link B-C. Those are the MAC addresses for the
interfaces on that link. Similarly, the links from A-B and C-D
have their own unique MAC addresses. So the packet has
a pair of MAC addresses in its MAC header which are for
that link only, and inside that are the IP addresses for A and
D as source and destination of the packet.

Host B needs a different MAC address for link 1 than for link
2, and host C needs a different MAC address for link 2 than for
link 3. The end nodes only need one address, and that could
be the host IP address, but that won't work for B and C. If we
give them 2 IP addresses, one for each interface, then what
address is used for packets destined for B or C?

It would be different depending on the path of the packet. That's
bad network design. A host needs to have a single unique host
address that applies to it globally. It then needs a unique MAC
address for each physical interface it has.

When any packet comes in, it strips off the MAC header, discards
it, and looks at the destination IP address to see what to do with the
packet. If the destination IP address is its own, then it internally
consumes the packet. But if that address is that of another station,
it decides which interface it needs to use to forward it, and routes
the packet along toward its final destination using the MAC wrapper
appropriate to that link.

In the very simple network outlined, the MAC addresses could be very simple. A single digit number would be a sufficient MAC address. But in a more complex network where there can be more than one other station directly reachable by a given interface, a larger MAC address space is needed to remain unique on that link. But it is unlikely that a MAC address as large as an IP address would ever be needed, since the number of stations directly reachable on a given link will always be less than the global number of stations reachable by the network.

A one or two octet MAC address is probably always going to be sufficient for amateur links (*physical* subnets). That can be derived dynamically from a hash of the station call sign with a high probability of being unique on that link.

You have to answer the basic question:

Are the two houses line-of-sight between each other.
(no trees, hills, or buildings, etc).

3 miles is not that far, but unless you can climb to the roof
of each house and see each other, then you are going to
need some serious power, or multiple hops.

Is there a Ham between you two who can help?

The 10 GHz article was a good one, in that they did some
great antenna designs. What's missing from the article is
how much it all costs. Gunnplexors (the kind with varactors
in the cavity) are not cheap at 100 mW. By the time you get
the antennas built, the Gunnplexor electronics built, etc, etc
you will have a serious investment.

Then the problem. What are you going to use to pump the data?
The original article used some surplus 2 Mbps cards (hell, these
were surplus 10 years ago, they would have to be ancient by
todays standards.

My advice, unless you have some serious time and money on your
hands is to avoid 10 GHz for "cheap" data application. It isn't
going to happen. On the Web page you mentioned, you are going
to pay $175 just for the Gunnplexors, and then you'll have to spring
some more bucks for the 100 mW Gunns.

Proxim makes a 1.6 Mbps 2.4 GHz FHSS ISA card (Symphony):

http://www.proxim.com/symphony

These cost $150 each and produce 100 mW. You can get some
good beam antennas for these for about $150 each (they look like
antenna-vision square screens and feedhorn. These will give you
about 19 dB gain. Then if you need more, you can buy an amplifier
for about $650. This is about $1000 per node, or the equivalent
money of what you'll put into a 56 kbps link. The 10 GHz link will
be cheaper, but it will take you a couple of years to find all the parts.
The Proxim stuff is off the shelf.

I lost the page with antennas and amplifiers (was a complete unit
with dish and amp with Type N connectors...

There's some driver work on the Proxim cards for Linux at:

ftp://ftp.komacke.com/pub/rl2isa-driver/

This is needed because the Symphony cards only come with
Win95/98 drivers, and that OS can't gateway.

An IP address identifies a specific host, but not vice versa.

I'm still not convinced MAC address need to be different than
the associated IP addresses. In my own experience (*nix mainly)
each interface normally has it's own IP address. i.e. one to one
mapping between MAC addresses and IP addresses.

Multi-homed hosts raise further complications.
One of my machines at work has 5 host names,
but only one MAC address. Perhaps I just answered my
own question <smile>, at least for the "standard unix
networking case."

>
>An IP address identifies a specific host, but not vice versa.

To be precise, as you indicate below, an IP address maps to an interface.

A host may have more than one [physical] interface.

Each physical interface may have more than one IP address, (sometimes
called virtual interfaces).

>I'm still not convinced MAC address need to be different than
>the associated IP addresses. In my own experience (*nix mainly)
>each interface normally has it's own IP address. i.e. one to one
>mapping between MAC addresses and IP addresses.

Well, there may be a one to many mapping between MAC address and
IP addresses, but each IP address maps to only one MAC address.

In an Internet environment, MAC addresses don't have global visibility,
(they are not visible outside of the subnet, e.g., a physical Ethernet
segment). This is motivated by the (nearly) random assignment of
MAC addresses, (they are generally burned in by the interface
manufacturer). Perhaps the major advantage of keeping MAC addresses
visible only on the local subnet is that IP addresses in routing tables
("IP routes") can be aggregated, (because IP addresses are assigned
rationally with respect to network topology -- all IP addresses on the
same subnet have the same higher-order bits). That is, one entry in an
IP routing table might point to 32K possible hosts. For example, the
routers in the core of he Internet probably still have fewer than 50,000
routes. This contrasts with having to have a routing table large enough
to hold the the MAC addresses for every Internet host, since MAC addresses
are assigned without regard to network topology and can't be aggregated.

[I hope this very terse summary of a fairly complex area actually makes
sense and is useful...]

So, could you get rid of MAC addresses and use only IP addresses?
Probably, but you ought to consider a number of issues first. A significant
one is how you will aggregate routing information for hosts that are far
away. (It is not clear to me that this is done very much with amateur
protocols.) Another might be how you will handle hosts that don't have IP
addresses, (e.g., tough luck). Has anyone thought extensively about
the role of and need for MAC addresses in amateur and/or wireless networks?

>Multi-homed hosts raise further complications.
>One of my machines at work has 5 host names,

>but only one MAC address. Perhaps I just answered my
>own question <smile>, at least for the "standard unix
>networking case."
> [...]

Generally, the term "multi-homed" indicates a host with more than one physical interface. From the perspective of IP routing and the Internet, each IP address is treated independently. That is, the Internet doesn't know or care when routing an IP packet that two IP addresses are actually on the same host.

Of course, a _name_ may map to several IP addresses. Most things generally work better if all of the IP addresses associated with a particular name are on the same host. However, this isn't a requirement. For example, some people are playing games with DNS to that a single name maps to many hosts, so that, for example, multiple servers can share the load.

That "namby pamby" PC will survive a lot more than you might
imagine. We've been using PCs as switches on unconditioned
high sites for 13 years, the only problem we've had with drives
is that they eventually wear out their bearings from running
24x7. So every couple of years or so we venture up the mountain
to replace the HD.

But you don't have to use a drive at all unless you want to. Just
burn your code into ROM and plug the ROMs in place of the
BIOS ROMs. It'll boot up running your program that way. PC
motherboards are the defacto standard custom embedded
controller these days. They're cheap, extremely widely available,
development tools are also cheap and widely available, and there
is plenty of horsepower for whatever task you might need done.

The fact that you can get replacement boards on any street
corner is very important. If your board gets fried by lightning,
you don't have to wait weeks to get a replacement for some
special low production volume card. That translates to improved
network uptime.

One of my machines at work has not only several host names for the same
MAC address, but several IP addresses, too.

Looking for someone to help me setup jnos111,anyone out there willing to
take on the job with this newbie? I promise to have lots of questions,
some dumb (the ez-est to answer)some hard,some...well....
So far to me it was ez-er to setup and run fbb.
tnx de dave-n2rhl

My JNOS has about 5 MAC addresses, two host names, and
two IP addresses :-)

5790. PacComm TinyII MK2/GPS MFJ-8621 APRS configuration

Newsgroup: rec.radio.amateur.digital.misc

Hello Everyone,

I have recently purchased a PacComm TinyII MK2/GPS and MFJ 8621
stand alone APRS transceiver and would like to set up a
beaconing/tracker system. Does anyone know what the appropriate
commands to program this specific TNC to perform this function are? The
TNC has the open squelch DCD option and is able to transmit and receive
packet info via the MFJ-8621 however I'm at a loss regarding
configuration for tracking/beaconing. Any info would be appreciated.

Thanks and happy New Year!
